Me translate.

The best vt 100 emulator is uniterm which is strictly pd/freeware.
A friend of mine used to work for Digital Equipment corp. He would work
from home using his ST wiht Uniterm.

Of course his other post didn't have this, so I don't know what happened.

The 1040STe has a weak powersupply. Probably this is your problem.

>
>I paid $150 for mine with a MIDI sequencer (Edit Track Gold), and a SM147 mono monitor.

You can get STes from anywheres from free to $50.00. Some NEW ones are
available for $99 at Systems for Tommorrow.

>Also, how can you tell how much RAM is in your machine? I took it apart and I see 4 30 pin simms in> there, but don't know how big they are. anyone know? (might scavenge it for parts if my next machi>ne doesn't have enough RAM)

You can find a ram test program at
http://www.umich.edu./~archive/atari

If you don't have any Zip or LZH programs for the Atari, get STARTER.TOS
first. It is a self extracting archive which will get you the programs you
need to unzip, unlzh the programs on the Site.

Later Brian.

If all you need is computer for Midi sequencing, no audio, then all you need is 1040ST with 1Mb and a monochrome monitor. Don't get a colour monitor, as it won't work with most software. You don't need a hard drive, but you can add one later on if you want to. Cubase works with 1Mb, but is better with more. I would suggest a 520 or 1040STE as these can be easily expanded to 4Mb, otherwise get a MegaST2 or MegaST4 (2 or 4Mb, not easily expandable) could be good because of the small space factor.

As for the price, 100 Euros sounds correct for setup like this.

The hard part is getting the software. If you can, it's better to buy a complete ST with Cubase or Notator, because it's difficult to find the software alone. Avoid pirate copies, because they are practically unusable.

I've no idea what your Amiga hardware is like, but:

A 1040STE will take 4x1Mb 30pin simms. Other STs need special expansion
boards for RAM upgrades.

An IDE or SCSI hard drive can be used with a special adapter.

Some of the Freeware Sequencers like Hollis research's TRACKMAN is
pretty good. Also Sweet 16 is easy to use as well. Put in ATARI MIDI
SEQUENCERS as a search and stuff will come up.

You can also go to my site for some screen shots and ideas on
sequencers for Atari.

I think the MIDI timing is a lot tigher on the Atari though. Even PCs can't match it.

There is lot of things what can cause 'die' of ST. For example simple
contact error at IC sockets

Simms may be of 256 KB or 1 MB. But you can easily count it - if you know
at all how many RAM had your 'dead' ST :-) .

Hello,

if you are a HAM (Radio Amateur), still using/having a Atari ST computer
and you are interested in using highspeed (9k6) packet, but not want to
spend to much,
maybe this modem & driver is interesting solution for you.

Hardware & software where develloped by Chris - OE5DXL for Atari ST, it
uses/tricks the MFP chip.
(btw. there also is a version for PC)

Remark: The L2STX driver only supports hostmode packet-prgs.
(i just updated the page with a new version of SP - a update from Odo,
dl1xao)

I have build the Atari version a few years ago, and after it worked i have
sold my expensive 9k6
TNC ;-)
(this modem costed me only 10$)

My website about OE5DXL modem/driver: http://www.qsl.net/pe1nib/

|
|Don
|

I checked my Mega Ste for a steprate program in my autofolder and didn't find one. I use Superboot 8.1. It has an option to change the steprate for each floppy drive. It's shareware.

I did a quick check at http://www.umich.edu/~archive/atari/Diskutils and found a couple of programs. Seekup 1.0 apparently only works on a Mega Ste. IBMDRIVE.LZH has a seekrate program that runs from the desktop.

There are other programs that change the steprate that I have seen in the past.

Hi all!

Now that it's possible to listen to MPG-3 files (on Falcons) is it
possible to create them?

I'm doing a website for a friend, who is a musician. What I'd like to do
is to convert a track from his CD to an MPG file that could be downloaded
from his website as a demo of his CD, to help sales of it.

Can this be done on a Falcon (or any Atari)?

Cheers!

James

> I can find that?

Hi Max!

I would get the (ex-commercial, now freeware) Connect. This does VT52, VT102 (ANSI), VT100, and VT220 (7 and 8 bit). There are three versions: a v2.46, and later a 95 and 97 version. In my experience though the 97 version is too buggy, but the previous two versions are fine.

I don't have a URL for it, but try the following address for D&D Translations, who do an English translation of the program, their site may include a link to where you can get it from.

http://www.cix.co.uk/~derryck/index.htm

Cheers!

Depends. An STE or Mega STE will take 1 meg 30 pin SIMMs, and will also accept the 2,5" IDE drive of the A1200 when equipped with an adaptor (AT BUS TOS Card including the 2.06 TOS ROMs and an AT/IDE bus). The Falcon030 is much better for your purposes, though, for it has superior audio capabilities (16 bit PCM with up to 50 kHz stereo, digital interface to plug in an SPDIF interface, DSP for sound effects, etc.), already has a bus for an internal 2,5" IDE drive and external SCSI (e.g. for writing CD-Rs).

I just really need a sequencer with decent timing - I've got a sampler for audio stuff.
I'm gonna use my PC to record and add mastering fx.

My PC is crap at MIDI timing (Cubase and Win), and I've heard the Atari has the best MIDI timing around.

Those prices are already give-away, and you won't find
new chips for much less than that. Is it worth the hassle?

A good place to try is always www.emulation.net
There are icons there from NoSTalgia/PowerST and the web page itself
really. Then it's time to search the net... good luck :-)

Does this happen after you have changed the disk in A:\? If so, try pressing [Esc] to force a re-read before copying, because your OS only knows about the old drive directory and so may overwrite it when faced with a different directory structure. This seems to happen with some disk drives and/or OSs that do not evaluate the disk change signal correctly (also on some STFMs that have had the drive replaced).

You could also try installing FMC.PRG in your AUTO folder, which is supposed to force media change signals.

Regards, /Peter/

Do you mind telling me how you do that? In the mean time I tried
switching to GCC 2.5.8 PL1, hoping that it would have all the required
libs (for example, in the first one I donwloaded I didn't find
libgcc.a!). But almost the same thing happens, except different symbols
are undefined (_cout and three ostream::operators). This is how I tried
to compile my example, assuming libgcc.a would be g++.olb:

gcc -lg++ Printer.cc

Thanks.

>
>Dave

Yes. You will need a db25 pin serial cable for the modem port on your STe.
You will require an external modem. 14400 or 28800baud will suffice. You
should be able to find these forsale, used and affordable.

Your STe is only capable of a transfer rate of 19200. So the extra baud on
the 28800 is wasted, however at 19200 you are still much faster than 14400.

You will require the following software.

HSMODEM. This program has a number of patches for the Atari ST serial port.
You will use the MFP program for the STe.

Since I don't know whether you are getting email via a BBS or an Internet
Provider you will require one of the following to connect.

A terminal program to connect to the BBS, such as
CONNECT, UNITERM, VANTERM and many more. Some can be found at
http://www.umich.edu/~archive/atari.

To connect to an ISP. You will need a TCP-IP program and dialer.
Freeware version available is

STING=TCP-IP and Dialer

There are many email programs that work with STing.

These can be found on Flinneys STICK pages.

Unfortuneately, I don't have the current URLs handy for Flinneys or STing.

If you wisht to use your STe for the internet, I suggest you increase the
ram, up to 4 megs and add a harddrive, be it internal IDE or external SCSI.
Both of which will require either and adapter board for IDE or a SCSI host
adapter for the ASCI port.

Hope this helps as a start.

Yes, hooking up a modem to the ST is no problem, Just don't buy an INTERNAL
MODEM.

Later Brian.

>CAB.OVL for your TCP/IP stack.

Well, not as much incorrect as possibly confused. I mentioned that the commercial version of CAB requires Magic. This is infact true, If I am to understand that CAB and ICONNECT come bundled together and therefore require Magic. Hence, if he is to choose to purchase CAB for Web Browsing it is in his interest to know that it expects Magic.

Taking this into consideration, I offered the Alternative that he can still purchase CAB 2.7 or 2.8 for that matter , and use STING, and the Correct CAB Overlay that works with the STing Stack.

I didn't want him to misunderstand that he could purchase CAB and plop it into his SINGLE TOS machine and start web browsing. Because to Use Single TOS you must use STING and this is not available in the commercial package.

Therefore it can be confusing to someone who may have no idea what we are talking about with regard to the various CAB OVERLAYS and different Stacks such as Iconnect and STing.

If he does have a 2 or 4Meg STe and has Magic then the commercial version of CAB is not nearly as much a pain in the butt, as if you buy it and have to make the choice of either buying Magic, or getting all the STing modules and paths set-up.

So while it is not accurate to say that the commercial version of CAB requires Magic, because it is Iconnect that does, it may be difficult for new readers to separate the browser from the STack. Particularly if one is used to using IE.

We are on the same page here, you are correct. Hopefully this message won't confuse.

Later Brian.

Yes, but the ST is limited to 19.2Kbps. Therefore, anything above a
14.400bps modem is a waste.

Last Updated 02/06/00
- Sold / traded items removed

I have the following Atari ST components, software and manuals/magazines for sale. All the equipment is cleaned and detailed, and in good or better condition, but without boxes unless noted. If you have any questions in regards to unit condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to Jim at jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.ST (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

Hardware Please make an offer
==========
- Atari 520 ST - with mouse but missing power supply (fully functional)
- Atari Mega4 ST - Boxed with keyboards/mouse/power supply
- Atari SC1224 Monitor 13" ST Color Monitor
- Atari PCT1426 Monitor 14" High Resolution TT/PC Color Monitor
- Viking 1280 x 960 20" Monochrome TT Moniter - Boxed
- Atari SF354 3.5" Floppy Drive - with drive cable, no power supply
- Atari SLM804 Laser Printer - boxed with power supply and Laser Printer Controller
- Atari Megafile 44 with built-in Tape Backup - with power supply and cable
- Atari Megafile 60(s) - with power supply (two units left)
- Magic Sac 1 - Macintosh Emulator Cartridge (with manuals, but NO ROMS)
- Magic Sac 1+ - Macintosh Emulator Cartridge (with manuals and ROMS)
- Custom made Atari RGB/Audio cable. Connects an Atari ST to either a SONY XBR or XBR II RGB Monitor
- Best Data Smart One 2400X - 2400 baud modem

Controllers Please make an offer
==========
- Paddles (multiple sets) - for Atari & Commodore units
- 2x Suncom Tac Joysticks - for Atari & Commodore units
- 1x Spectravideo Joystick with suction cup base - for Atari & Commodore units

ST Software Please make an offer
==========
- UltraScript for MEGA ST- by Atari (with manual & software)
- Ultra Script Type Collection - Packages 1-7 (Complete with box, manuals, & software)
- Macro Mouse - The mouse recorder (Complete with packaging, manuals, & software)
- Calamus Desktop Publishing (Complete with box, manuals, & software)
- Spectre GCR Mac Emulator with ver. 3.0 update manual (Box, manuals, software - NO ROMS or cartridge)
- Flash Telecommunications package (Complete with packaging, manuals, & software)
- Flash II Telecommunications package (with manual and software)
- Dungeon Master - by FTL (Complete with box, manuals, & software)

ST Books Please make an offer
==========
- Atari ST Volume One VDI
- Atari ST Volume Two AES
- Atari Volume Three TOS
- Atari ST GEM Programmers Reference
- Atari ST Tips & Tricks
- Atari ST Internals
- Programmers Guide to GEM
- MC68040 32-Bit Microprocessor Users Manual - by Motorola
- MC68000 8/16/32-Bit Microprocessor Users Manual (eighth edition) - by Motorola

Manuals & Technical Guides (software status specified) Please make an offer
==========
The majority of the ST/TT manuals are of the binder variety
- Micro C Shell - by Beckemeyer Devlopment Tools (without software)
- LDW Power Spreadsheet - by Logical Design Works (without software)
- Superbase Personal - by Precision Software (without software)
- dBMan - by Atari (without software)
- 1st Word Plus - by Electric Distribution (without software)
- HyperPaint - by Atari (without software)
- Easy Draw - by Migraph (without software)
- Regent Base/ Regent Base 2 - by Regent (without software)
- Publishing Partner Professional / PageStream -by Soft Logic (without software)
- Publishing Partner - by Soft Logic (without software)
- Touch-Up - by Migraph (without software)
- Microsoft Write - by Atari (without software)
- Codekeys The Macro Tool - by CodeHead Software (without software)
- Degas Elite - by Intregal Sollutions (without software)
- Brataccas - by Psygnosis (without software)

Atari Force Comics Please make an offer
==========
All are in Mint Condition

- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games
- A working Vectrex controller
- A working DSS Satellite Receiver with H Card
- Working DSS HU / P3 Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

>>A:\ all the files are deleted on A:\
>
>
>Does this happen after you have changed the disk in A:\?

Yes indeed. Also : when I have a disk in A, write to it and save, the new config. can be read but as soon as I do a reset (without changing disk), all the files are lost.
>
>If so, try pressing [Esc] to force a re-read before copying, because your OS only
>knows about the old drive directory and so may overwrite it when faced
>with a different directory structure.

Well after applying this trick the fileselector on the screen started to vibrate and now it became impossible to write to the disk in A at all. (doesn't matter, it was already rotten !)

> This seems to happen with some disk
>drives and/or OSs that do not evaluate the disk change signal correctly
>(also on some STFMs that have had the drive replaced).

Could it be the OS ? I know 4 Milan users who use the same Milan TOS 4.08 as I do but they don't have problems. So it must be the diskdrive ?
>
>You could also try installing FMC.PRG in your AUTO folder, which is
>supposed to force media change signals.

I'm going to try that first, if it doesn't help, I'll try the diskdrive change.

Thanks for your advice,

Cheers

Atari Games for Sale !!!!!!!

E-mail : oscar@agra.fsnet.co.uk

Work in all ST/STFM/STE Machines.

NOTE : All prices (noted with the symbol #) are in UK pounds
NOTE : All games are original, NOT copies !

** OFFER : Buy #10 pounds worth of gear and get any single game FREE

List of Productivity Software/Hardware : (#7 each + shipping in pound sterling)
---
* STOS Maestro Plus (Hardware Sampling cartridge and software included)

List of Compilations :(#4 each game + shipping in pounds sterling)

** (ALL BOXED + MANUALS + ORIGINAL DISKS) **
* Giants
(includes Outrun, Gaunlet II, 1943 and Street Fighter)
* Quatro Sports
(includes BMX, Italia 90, Advanced Ski and Pro Tennis)

List of Games : (#3 each game + shipping in pound sterling)

(ALL BOXED + MANUALS + DISKS)

* Baal
* Batman
* Deja Vu
* Driller
* F-19 Stealth Fighter
* Falcon (Game + Mission Disk Vol 1)
* Galdregons Domain
* Gold Rush
* Heimdall (1 Meg)
* Hook (1 Meg recommended)
* King's Quest II
* King's Quest III
* Quadralien
* Leader Board (Game + Tournament Disk Vol 1)
* Lotus Esprit Turbo Challenge 2
* Midnight Resistance
* Midwinter
* Navy Seals
* Night Breed

* Operation Wolf
* Premier Manager 2
* Rick Dangerous
* Robinson's Request (1 Meg)
* Shadow of the Beast
* Sly Spy - Secret Agent
* Space Quest II
* Space Quest III
* Spy vs Spy (Artic Antics)
* The Quest for the Time Bird
* Transartica
* Uninvited
* Zool

List of Games : (#2 each game + shipping in pounds sterling)

(NOT BOXED ONLY ORIGINAL DISKS + MANUALS)

* Another World
* King's Quest IV
* Leisure Suit Larry II
* Leisure Suit Larry III
* Operation Stealth
* Police Quest II
* Secret of the Monkey Island
* Storm Master
* Street Fighter II
* The Godfather III (Action Game)

List of Games : (#1 each game + shipping in pounds sterling)

(NOT BOXED, (1)NO MANUALS, (2)ONLY ORIGINAL DISKS)
(1)Manuals are not really needed to play these games anyway
(2)Original Disks, we do not sell pirated software,so don't even ask.

* Alien Syndrome
* Crystals of Arborea
* Hard Drivin'
* Indiana Jones and the Last Crusade (Action Game)
* Oil Mania
* Panza Kick Boxing
* Rock 'n' Roll
* Silk Worm (Boxed but no manual)
* Spitting Image
* Strider
* Trinity
* Trivial Pursuit
* Wrestlemania

I use PENGUIN with good results. First I do write my TXT files (in a text editior like 7UP), get what GIFS, backgrn images, ect, Midi files, ect all in the same Directory.Then Run Penguin. You go through the Questions. It saves it as HTM. Then I take it into JOE or 7UP and edit it some more to my liking, viewing it on CAB to see the results. Most of my pages were done this way. See my site listed below

> partitions and some other effects I had with Cecile).

ATA3 is a -must have- with a "new" IDE for CT" F030.

> The problem where there are only running stripes and the falcon doesn't
> boot seems to be connected somehow with the monitor plug. At least I got
> the feeling that by moving the monitor cable I can get the machine to
> boot. Can anybody tell me if that's possible or just coincidence ?

Falcon IDE -is- the CPU Bus, some driver signals add, generated by COBMO
and you got the "great" Falcon "IDE Port"..
No extra driver ICs support that "IDE"
Shorten IDE wire as you can.

Display trouble mostly are from the same source.

Regards, Robert

also you may want to check out
http://www.cix.co.uk/~derryck/

here is the text that Derryck includes:
"MagicSLM (German docs) A software solution to the problem of printing
from a Falcon/PC/Mac or whatever to Atari's SLM804/605 laser printers
using an HP Deskjet or Laserjet 300dpi driver on the client computer.
You will need the ST (minimum 2Mb memory), the Diablo emulator
(available on ftp sites), and a null modem cable to connect the two. Use
the highest common baud rate, 8-N-1 with no handshake on the ST, same
settings but XOn/XOff on the client computer, or if you can't redirect
printer output to the printer port you may be able to print to a disk
file and take that to the ST (full package).

>
>Ah, thanks - do you know *how* it is extended?

IIRC the Extended bit is the vertical resolution. Effectively you have multiple Spectrum pictures one above the other, or maybe even part pictures. So instead of one image of 320x200 you could have an SPX of 320x400.

I am not sure how they were created but the viewers would allow scrolling.

Unfortunately I can't help you in trying to convert them.

Rich.

1975. Attachment coding by Newsie

Newsgroup: comp.sys.atari.st
Date: 2000-02-07 00:00:00 UTC
From: vdjole@EUnet.yu
Message-ID: <87nav1$1hb$2@SOLAIR2.EUnet.yu>
Source record: 65856

Hi;

Recently I encountered a problem with sending files attached to e-mails
by Newsie. The recepients were PC/Windows users and some of them could not
extract my UUE-coded attachments. E.g. Outlook Express recognized the
attachment but then extracted zero-length files.

When I re-sent the files using Mime64-coding, they cold be extracted OK.

Does anyone know whether Newsie has some peculiarities when UUE-coding
attachments, or is PC software THAT stupid. I thought that UUE is UUE,
known to all, not much room for any misunderstanding between two
applications.

Or is it maybe just stupid PC users who don't know how to set-up
their e-mail programs?

Thanx in advance.

What are the jumpers for?

I have built many a PC and fiddled inside a few ST's and NEVER seen
jumpers on a floppy drive... Hard Drives yes but a floppy...

or are these jumpers on the keyboard?

>
> Can this be done on a Falcon (or any Atari)?

It therory it should be possible on ANY pooter depending on it's RAM obviously... and of course it's CPU will affect speed. I don't know of any Falcon specific encoders, BUT you may be able to compile BaldeENC for the falcon. I believe the source files are freely availibe on the BladeENC website. I can't remeber the URL off hand, but if you do a search for it you should find it easily enough. The source is for Linux but I'm sure it should be fairly simple to change to work with your Falcon.

Good luck on your quest.

Graeme

```
The Atari SC1435 is not a VGA monitor, but RGB. It should be plug and play,
either with a built-in cable or a SCART cable. Try the QuicK FAQ for DIY
plans.

I mentioned once already. Try running the INSTPRNT program from the tools
folder, reselect your printer. This fixed my non-working NVDI 5.03 setup
after using the freshup which manages to disable the drivers.

Nah, ALWAYS send UUE. It keeps them guessing. :-)
Seriously, a search of Outlook Express yields no command that
could select between UUE and MIME. Either it's transparent, or
Express just can't handle it.

Unless you have something installed wrong, I'd certainly call it
a flaw with NVDI 5. As you mentioned, my NVDI 4 displays the
printer names just fine (although Works only displays printers
(drivers in the 20s).

For a CD? How much amperage do you think you need? Actually,
$100 is about right if you want it for a HD, but a CD (not CD-R)
can do with much less in terms of quality. New, I'd look at
www.corpsys.com -- they look like they have a $80 one.
Otherwise, MacMall is selling one for $99, including the CD
mechanism! And of course, there's always EBay.

I suggest you turn off everything you can and try one thing at a
time. Perhaps try STing as well. I have no idea what your
trouble is, but it is well established that I-Connect, CAB 2.5,
and Magic5 will work on a Falcon, so I suspect either a
corrupted file, a conflict, or some other annoying yet
correctable problem.

Does I-Connect work with other applications?

1990. Re: WEB Page Designing?

Newsgroup: comp.sys.atari.st
Date: 2000-02-07 00:00:00 UTC
From: Peter_Schneider@su2.maus.de
Message-ID: <200002072152.a38898@su2.maus.de>
Source record: 65871

```
Hi John,

it's shareware. Here I'll give you the README file that came with a
demo version:
==================================zip=========================================
HomePage-Penguin v1.62
----------------------
Written by Matthias Jaap
- English doc -

If you have ST-Guide installed you should read the HPPING_E Hypertext.
It is more detailed than this Readme.

1. Status
---------
HP-Penguin 1.62 is SHAREWARE. The work on this program is enormous and
I think that a shareware fee of 20 DM is something that everybody can
afford. So please support the work that has gone into this program and
I promise that there'll be many more updates...

Please transfer the money to:
Account nr: 5866 31-209
Account holder: Christine Jaap
Bank: Postbank Hamburg
Bank sort code: 200 100 20

Please write that you registered for HP-Penguin on the transfer paper.

Please make sure that you have everything correct before transfering.
If you are unsure, contact me before transfering.
----------------------------------------
Changes to the the text, resources or the program are forbidden!

Distribution by PD libraries and BBSs is allowed. Penguin may not be
included on cover disks or CD collections without my written
permission.

2. Improvements
---------------
Version 1.3 - 1.451: HP-Penguin runs also as an Accessory and
even under MultiTOS. This has been achieved by using the
GFA-Flydial-Library 4.9 by Gregor Duchalski.
Version 1.45 - 1.451: Complete translation of the comments!
The headings can now be set seperately
few bugs fixed in the German RSC-file
1.452: Bug fixes! English RSC should now work.
Image name converted to lower case letters.
```

Image size automatically recognized (GIF only)
1.5: 'Set Layout' dialog. 'Extended' and 'Freestyle'
are planned for version 1.7 .
'Professional' modus: In this modus you can
change the size of the headings, use up to 10
links and set the colour for activated links.
The HTML file can be put onto the clipboard.
Problems with Atari fileselector fixed.

3. System requirements:

Computer : Atari ST/TT/Falcon, TOS 1.4 - 4.4, MultiTOS, MagiC(PC/Mac)
Resolution: 640 * 200 or higher
Memory : HP-Penguin will take about 100KB of memory.
Application type: ACC or PRG. Pure GEM.

With the HP-Penguin you can create your own HTML-page without knowing
any HTML-commands. You create it by answering a few questions. You can
choose a background, make a two-column-text, insert a picture and many
more.
Please note that HP-Penguin has NOT an integrated editor. You have to
use an editor to write the text for your web page (it must not contain
html commands). The reason why HP-Penguin has not an own editor is,
that it would increase the program length dramatically. And there are
already some great editors around. By the way, the Penguin will
recognize the paragraphs correctly (okay, it's just a very stupid
little routine that sets a paragraph if the length of the line is
lower than a user definged length).

The program explains itself so it would be the best if you
start it right now!

This program has been written with GFA-Basic 3.5E on an
Atari Falcon. It is inspirated by a similar program for
Windows (Home Page Wizard).

4. The language

As said before, HP-Penguin is bi-lingual German/English.
A French version will follow soon.

4.1 Falcon owners
You are lucky when you have a Falcon because HP-Penguin
will look at the _AKP-cookie and will load the correct
RSC-file. If the desktop language is set to other values
than German or English, HP-Penguin will automatically
choose the English resource file.
4.2 ST/TT owners, MagicPC/mac
If you are owner of an Atari ST/TT you have to choose
the language differently. There are two methods:
I) Rename one of the two resource files will cause
HP-Penguin to load the other.

Example: Rename HPPING.RSC to HPPING.RSX
HP-Penguin will load HPPING_E.RSC.
This will also work on a Falcon.
II) Start the program without renaming one of the RSC-
files.
A box will appear with the question which language
you want to have.
4.3 Emulator users and ST compatibles
As I have no experience with Atari emulators or the new
clone machines, I can not say if you need to rename
the files or not.

5. Known bugs/limitations
----
1. Please close the HP-Penguin window if you are using the
Penguin as an ACC under Single-TOS and are starting a
program!
2. Webspace 1.45 doesn't view HP-Penguin pages correctly. This is not
an error of the Penguin! Wait until a better version of this very young
program or use CAB to view the pages.

6. Future enhancements
----
* You can see one in the start dialogue: Load HTML file.
* Perhaps I will use FaceValue for the next versions of HP-Penguin.
This would allow new features.
* Support for tables and the 'Extended' & 'Freestyle' option in
the layout dialog.

7. I would like to thank...

Sven Betz and Joachim Lï¿½hr of Betz Computer for their betatesting
and GFA-Basic tips.
Gregor Duchalski for his fantastic GFA-Library.
Noah Silva and Mille Babic for putting this and the other programs
on their download bays

8. Contact:

If you have any new ideas or you want to translate HP-Penguin to
another language, please e-mail me:

E-Mail: sa6z220@public.uni-hamburg.de

9. Other Internet utilities

9.1 HTML-Help
Conversion of special characters between HTML, Windows, Atari and
DOS (important for non-English texts). A conversion of paths is
also possible.

Other features:

* HTML commands can be removed to get the pure ASCII text
* The Information option shows you the specs of your page
* Hotlist
* Runs also as an Accessory and fine with editors like Edith
* Filenames in a HTML file can be converted to upper/lowercase
letters or shortened to the 8+3 TOS format.

9.2 Tabi!
Tabi converts ASCII tables which can be produced e.g. by Atari Works
via 'Import file...' to HTML 3 tables. You can set different font
styls, colours etc. for every cell. The file created by this program
can be insert in a HTML page and you have a table without typing a
single HTML command!

10 Compatibility

HP-Penguin should run on all Atari computers. It has been successfully
tested by various people on the following computers:

* Atari Falcon, TOS 4.04, TOS 4.92, Multi-TOS
* Atari Falcon, Geneva
* Atari TT
* MegaSTE
* 1040STF, TOS 1.4
* Hades
* Macintosh, MagiC-Mac
* Windows 95 PC, MagiC-PC

Iconnect works fine without Magic, despite what ASH might say.

And CAB works with STing and MintNet, which don't require Magic,
either. I've used it with STing without any troubles at all on TOS,
Geneva, and AES 4.1. In fact, I've had more troubles running it with
Magic than without (although these have been stabilized some).

Well, I set the stack too small (128K). You just need 'stack'
(binutils-2.9.1) or 'fixstk' to set the stack to 256K or more. And it
will work under Tos.

I can certainly agree to all of this, but the thing is, exactly why are
the printer names
no longer shown? I have NVDI set up correctly, I just have a problem as to
why I
paid for a program that appears to no longer allows me to view the printer
names -
I should not require a list on my wall to know what GDOS ID to select. NVDI
4
lets me view them, what was the reasoning behind this? Bad programming?

Leslie

2007. Re: Falcon help needed

Newsgroup: comp.sys.atari.st
Date: 2000-02-07 00:00:00 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <389E8B65.144F5E98@siemens.at>
Source record: 65977

What I forgot to mention in my initial posting is that my Falcon is in a 'Lighthouse' tower (much place inside and an extra PSU for the harddisks with 2A at 12V). I checked out that there is no PSU problem and no heat problem.
I was able to shorten the IDE cable, but it's still 37cm long. BTW the main argument to use the new IDE HD is that it's fast enough to use HDDRIVER instead of Cecile (i.e. no more problems with non-TOS partitions and some other effects I had with Cecile).
The problem where there are only running stripes and the falcon doesn't boot seems to be connected somehow with the monitor plug. At least I got the feeling that by moving the monitor cable I can get the machine to boot. Can anybody tell me if that's possible or just coincidence ?

thanks
Gerhard

Timing on PC's is horrid. Amiga is pretty good but Atari is probably better.
I know a couple of people who have used MIDI on Amiga to good effect, but
Atari's are renowned for their excellent MIDI timing so I see where your
coming from.
I just threw the Amiga option into the hat...

Regards,

Clockmeister.

2017. Forget about Sun monitors...

Newsgroup: comp.sys.atari.st
Date: 2000-02-07 00:00:00 UTC
From: jba4@po.cwru.edu
Message-ID: <389f062c.598962118@news.cwru.edu>
Source record: 65987

Hey everyone! This is going to be my last message about Sun ECL monitors on the TT030. Apparently, I have been told that the TT operates at:

1152x960 @ 72Hz vertical

Anyway, Sun monitors operate at the following

1152x900 @ 66Hz vertical (low -res models aka 365-1051)
1600x1280 @ 66Hz vertical (hi-res models aka 365-1016)

From what the Sun hardware folks tell me, these Sun ECL monitors are fixed frequency and will absolutely not operate at the Atari's resolution or vertical frequency, no exceptions. They also said that these two resolutions are the only ones manufactured for Sun. There was a third ECL model, but it operated at the same specs as the hi-res model listed. So of the three types of Sun ECL monitors made, none of them can sync with the Atari or produce the correct resolution. Sorry everyone!

Sure wish I had figured this out before I soldered a cable to adapt them ;-)

No...real audio is a form of data compression, but it isn't mp3....no .ra
files or keys. That's a different thing.

Where did you find libraries/includes that work? I am trying to install one version of GCC that would work reliably enough, and didn't have much luck. Sometimes it's the libraries or includes, sometimes binaries... It seems there's no one FTP site where you can download the full distribution, but it's all bits and pieces that you have to collect from all around. I wish somebody would post some installation notes on how to get a complete and reliable version of GCC.

If you have 2.8.1c try this and you'll confuse the pre-processor:

```
#include <stdio.h>
#include "whatever.h"
/* use some things (typedefs, prototypes...) from whatever.h */
```

If you put #include <stdio.h> in "whatever.h" it will be ok.

Also, try using getc() function from <stdio.h> and the compiler will complain
about its defintion. I think what we have is an obsolete version of <stdio.h>.

2022. Atari's : For Sale or Trade

Newsgroup: comp.sys.atari.st
Date: 2000-02-07 00:00:00 UTC
From: bytor <marvinjrNOmaSPAM@mindspring.com.invalid>
Message-ID: <074be390.a1baccdb@usw-ex0106-046.remarq.com>
Source record: 65992

I have three 1040STf for sale or trade (icluding mouse and power
cord and Atari Language Disk for each).

I collect Atari. The idea here is not to make a lot of money,
but to keep my Atari collection growing!!! I am interested in
trading for the following (you can ask to trade for one, two, or
all three depending on what you have. Some may even be able to
get some extra cash as well):
260ST
520ST plus
Mega ST
Stacy
St book
Atari PC (any)
ICD SCSI Host Adapter
Atari to PC keyboard adapter board
RAM expansion board for Falcon (72pin SIMM board)
CAB 2.7 (English version)
MagiC (English version)
Cubase Audio Falcon
I also want an Amiga or Mac [don't shot me :-)
..of course anything else interesting !!!

Thanks,
Bytor -Nashville, TN USA

Hi All

Following on from the recent short discussion Re. Address 2.2E and its incorrect date reporting. I beleive it was Hallvard that instigated the thread.?

A birthday was due last month which was correctly reported, today another birthday was announced and its date reported as 18:02:1990, my system clock is correct, my desktop clock reports the correct time, files are also stamped correctly. It seems this Y2K bug bites this backside at different times for different systems.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

>buy an inkjet printer now and the colour comes with it!

But at least in some you can put in a b/w ink cartridge only! :-)

BTW, I don't agree with the original reply. 19.2Kbps is over a third faster than 14,400bps, so it's not a waste. In any case, there is a fairly simple hardware hack that allows uprating an STFM's serial port speed, as I am sure you know.

In this case, it's Atari users hanging on to archaic encodings.

I recommend that you always use MIME encoding, from now on, and
forget about UUE completely. ;-)

>No - I get the same result with the LFNs and normal TOS 8+3 partitions.
>I guess as someone said, DE isn't reliable for paritions >256 Mbytes :-(

I had trouble trying to use Diamond Edge (version 2.04) with any partition
1 gig or more. Therefore, my two "audio" partitions (for use with CAF)
are only 850 megs each, and Diamond Edge has no trouble with them at all.
Note: This is with ICD Pro 6.5.5. When I used it with HD Driver 7, it
locked up in the middle of a defrag, and needless to say, if I didn't keep a
backup, it would have been U G L Y ! But that's a different story; one of
"Falcon SCSI bugs" and hard disk drivers and the way they deal with
"Falcon SCSI bugs" and such and blah blah GRRR!... ;^P

Now I'm not sure about long file names causing problems however, as even
though I use MagiC, I don't make use of LFNs.

> jumpers on a floppy drive... Hard Drives yes but a floppy...

Well, you didn't look hard enough. All Atari drives have these jumpers, and
so did PC ones until a couple of years ago.

Depending on the model of drive, various things they allow changing are:
Drive ID 0 or 1
Media change detect
HD Detect

Most of these have either been replaced by solder pads on the drive PCB, or
just disappeared, as these settings are no longer needed on PCs. They are
needed to use a PC floppy on an ST though.

There will be no complete guide on jumper settings as all drives are
different. The only possible source is the drive manufacturer.

I have a cable stashed away soewhere for connecting the Atari St to a 15
-pin hd connector. I used it ti hook up to my NEC 3D before I put the
Crazey Dots II in. I recall I have tried it with a standard VGA monitor
to get ST high-rez mode. The standard VGA monitors won't gp down to the
colour sync rates. I got the NEC 3D new as old stock after finding that
the newer 15" monitors coming out back then wouldn't sync down low
enough. I was surprised to find the Hyundai 14" I got new about 2 years
ago syb=nc's down to the lower ranges the older multisync's used to. I
think the 15" Hyundai might do that low range as well.

Coming back to it, the answer I guess is yes, cables do / did exist.

What do you call a regular monitor ?

I suppose you mean VGA. Yes, but this will be a monochrome only solution, no colour, therefore no games. Check out the Quick FAQ.

> >done.
>
> Then why are Pro and Audio the same price?

That was new for me. When I bought CD Recorder it was one package. Now
they split the package and the price, which is good for people who don't
want to produce Audio CDs (or don't want to make HD backups to CD),
since they need only pay half of what I paid.
With Pro, if you want to create an Audio CD, you can only drag WAV
(maybe other formats too, I'm not sure) files to the contents window
and have no further influence on the CD.
With Audio you can define the title and identification of the CD and
title and pause for each song (some CD players can display titles),
copy protection flag and who knows what else (thereby creating a real
professional Audio CD).
So Audio is superior for creating Audio CDs (also the UI is much better
suited for the task) but you can't do anything else with it.

I don't understand what that means. Do you agree that HDDRIVER is the
better one ? At least it is the only one where one can use more than
8 GB of one of the new big IDE HD.

> > The problem where there are only running stripes and the falcon doesn't

Source record: 65889

For those who have had interest in what ever happened to JTS (Atari)

Go here

http://hoovers.transium.com/hoovers.html?ticker=JTSC&id=47949&q=&qi=%2bkco%3a%22Jts%22&page=1&r=1.tbusref.R02680452&stag=%2da

The final remnants of JTS's hard drive business were auctioned off yesterday to pay their debts.

Atari still had a lot of technology patents which are still unknown as to their owners and status. naby of these patents were on the hardware and vaporware.

Does anyone know who is the actual owner of TOS now?

Hasbro brought the games, but what about the hardware?

I fired up my falcon after not using it for almost 8 months and after using windows 98 for that time, I found TOS/Gem to be so much of a relief. This is still very much a viable OS.

B.P.

Hello!

> Where did you find libraries/includes that work?

Don't know, I work at the moment on the current gcc compiler.

You can try gcc 2.91.66 from my site but in this release the c++ part
don't work correctly (but the problems are fixed with the next version).
You need an Unix MiNT setup too.

> Also, try using getc() function from <stdio.h> and the compiler will

MiNT-Lib 0.53 is the current version.

I don't think so - but they released "The Games: Summer Edition". The games are not the same and there are also different events but Summer Edition is quite well done and even features 3D graphics. There's also Tynesofts Summer Olympiad which has almost the same events as Summer Games.

BTW, you can play some of the classic Epyx games using the ZX Spectrum emulator!

>> This is infact true, If I am to understand that CAB and
>> ICONNECT come bundled together and therefore require Magic.
>
>Iconnect works fine without Magic, despite what ASH might say.
Yes and no, IConnect and CAB will run under MinT, but the other IConnect clients will not run, using IFusion it's possible to run STiNG clients without needing STiNG itself. One can now use *any* CAB OVL simply by having Ifusion installed. A MagiC & IConnect user doesn't need to be bothered about STiNG anymore :-)

Whatever your views on ASH may be, an inexperienced user who buys CAB, will start using IConnect. Once he's actually on the net he'll learn about STinG, MiNTnet etc... It seems quiet obvious to me when installing CAB, you'll use the supplied stack as well (which BTW is a lot improved).

Cheers from Belgium
Dennis

Thanks Frank for everything.

What do you think, should I make a list of all the bugs I notice and maybe post it somewhere. BTW I noticed another one, you can try it if you want:

for example, make these files:

./main.c
./include/main.h
./include/structs/struct1.h

1. from main.c #include "include/main.h"
2. from main.h #include "structs/struct1.h"

Step 2 won't work... :(((Too bad us atarians are left with only one dev. environement.

Source record: 65900

Hi Yann,

> Just looking information about how to set up MiNT-Net pppd files to use
> CHAP/PAP authentication...

I have MiNTnet working with PAP for a month now. What do you need to
know exactly? At the first you need a 'pap-secrets'-file in /etc/ppp/
(from where the pppd should be started). This file contains
<user-id> * <passwd>
in one line whith TABS, not BLANKS! Then the command line for the pppd
must contain 'user <user-id>' so the daemon can find the right password.
The secrets file may also contain several more lines for different
providers.

If you have any questions feel free to email me but add a CC to
altf4@lowinski.de so I can answer quickly.

>
>From what the Sun hardware folks tell me, these Sun ECL monitors are
>fixed frequency and will absolutely not operate at the Atari's
>resolution or vertical frequency, no exceptions. They also said that

Not without modifications. The vertical frequencies might be easy to fix,
most fixed-frequency monitors I know are only very 'fixed' on the horizontal
part.

Horizontal might be more difficult, but without knowing how much they are
apart, I can't tell.

Note that the exact resolution does not matter: the only thing the monitor
gets to 'see' is the horizontal and vertical sync frequency.

Well, I've had quite a bit of confusing info. I probably just copied
the number wrong. Still, doesn't match the Sun resolution...

>
>
>Not without modifications. The vertical frequencies might be easy to fix,
>most fixed-frequency monitors I know are only very 'fixed' on the horizontal

>Note that the exact resolution does not matter: the only thing the monitor
>gets to 'see' is the horizontal and vertical sync frequency.

Now, see, that's what I thought! I thought that the resolution didn't
really matter, but the syncs were the important parts. But the people
in comp.sys.sun.hardware convinced me otherwise. I think they might
not be too knowledgable in these ancient monitors over there anymore.
I still don't have the complete statistics on these monitors.

Now adjusting the frequencies and all that stuff is a bit over my
head. I really don't have much knowledge of electronics except for an
introductory electronics course. So I'm kinda stuck right now. The
statistics on the Sun monitor are:

1152x900 pixel 61.8khz Horiz., 66Hz Vert

So is there any easy way to go about adjusting the monitor to work
with the Atari?

PS- Thanks, Michael. I appreciate you input.

I donï¿½t knew the orginal language, they are all germans..

> to German, Thomas Raukamp was possibly very confused and got his wires
> crossed :-) Let's hope that this interview isn't a sample of the quality
> of the new STC magazine...

"confused" is a harmless word :) but that isnï¿½t all.

Specialy i mean parts how the "authors" talking about sofware what not
run on his own atari system.. and TCP/IP sockeds..

(Software what works perfecly! with a lot other machines)

What we should do if we got the next browser, mailer?
(And i hope we got new ones!)

Install also the 6.th TCP/IP socked to run that program?

Canï¿½t follow statements like that, sorry.

Last but not least, "authors" :-> sayd he will have a look to the Mac..

(I hope by god he found out, in the first week, that this machine needs
-ONE- TCP/IP socked for -ALL- relevant internet programs and that this
machine runs a lot other software as "outlook" or "bad bad munster"
Netscape too..

Correct me if i missunderstud some parts in that "nice" interview..
(Maybee must be a part of the translation too) :->

Further than, that interview fills the magazine, not more.
Remember me of better interviews.

Regards, Robert

Some floppies have jumpers and others not. I think an Atari A drive
wants a drive 0 and the pc wants a drive 1. (I'm sure someone will
correct me if I'm wrong :-))

> I have a Atari megafile 44. Can i connect it to my 520 ST?

AHDI 6.05 should detect it just fine. Otherwise, use CBHD.

For better transfer rates, however, I recommend purchasing
HD-Driver, instead of AHDI.

You can't. It's not available yet (and I spoke to Thomas Goettsch
of Milan Computer GmbH today). The prototype is still using EDO
RAM, not SDRAM. When it is available and tested, you'll be able
to get it from Mlian's UK agent, System Solutions.

>them, what was the reasoning behind this? Bad programming?

Yes - but bad programming in in Atari Works, not NVDI! I've just tried
it with plain GDOS as well as NVDI 4 and 5, and in none of them do the
printer names appear in the AW Print dialog. If you use only one
printer, then it doesn't matter as once set you can save the params and
it will come up that way next time. If you need to change printers, just
load ASSIGN.SYS into an Works window and you can read off the printer
names, or perhaps their abbreviations. The one for NVDI 5 should look
like this, after listing the fonts for various resolutions:

---snip---
21 PCL.SYS ; HP DeskJet 520

22 ESCP2.SYS ; Epson Esc/P2

23 CANON.SYS ; Canon

24 MACPRN.SYS ; Mac printer driver

25 PIN.SYS ; NEC P2200 and other 24-pin

26 ATARILS.SYS ; Atari Laser

31 META.SYS ; Metafile driver

61 MEMORY.SYS ; Memory driver

81 NTOFFICE.SYS; Driver for NT Office Fax

91 IMG.SYS ; Driver for creating IMG files

Your ASSIGN.SYS may not have the comments after the semicolons - if not,
I suggest you add them for future reference.

Regards, /Peter/

According to Mark Bains's A-Z, the TT ECL output is 1280*960*2, 67 Hz,
so vertical should be capable of being tweaked - in fact it ought to
lock even without tweaking!

The horizontal can be worked out, being 960*67 which is 64.32kHz and
again well within tweaking (or even locking) range, I would have
thought. Somewhere inside the monitors there should be a dust-cored coil
marked 'H freq' or similar. Adjust this with a long plastic knitting
needle filed down to a chisel-point to act as a screwdriver, turning the
core a little to come *out* of the former - usually anti-clockwise. Note
it *must* be plastic, not metal (otherwise you'll get serious
eddy-current heating), and *long* to make sure you keep well clear of
the high voltages inside the monitor, which can be lethal! Always work
with one hand in your pocket :-)

If this doesn't work, then I suspect the monitor(s) is/are faulty. Or
just possibly the sync polarity is inverted, though this is unlikely.

Regards, /Peter/

Glad to hear yours work.
1) What caches do you speak of?
2) Extendos 2.4b I believe. Its a little old now.
3) Nope, no problem ever on any including blue ones of which I have a couple. I am now building an nice Atari CD collection.

>though from what I have read so far it does sound like a bad CD!
>:-(

I think so, I am not one to want to send anything back. I finally tried it on my friends PC with a 24X CDR.

It too could read the HTML files, and show the directories. But when it went to copy the entire PC crashed before our eyes. Locked up solid and never returned. Couldn't even get the CD out with the software eject or the hardware eject. At least the Atari Recovered after becoming lost. Earlier last month my friend laughed at me when the CD didn't work properly. Blamed the Atari. Heh, heh, well I didn't have to reboot the computer to continue working or to get the CD out. But a good friend regardless as he spotted me space on his Visa Card to get the order sent up here.

So, I am very certain the CD is boffed. It goes back, hopefully a working one returns, along with a new order of stuff.

Roughly, yes. IDE is a hard drive abbreviation, whereas ATAPI
is the command set. Technically speaking, there is no such
thing as an IDE CD-ROM. Personally, I'd try E-Bay. My Falcon
is limited to around 2Mb/sec, which is roughly a 13x CD, so
anything faster than a 12x CD is not going to be useful, and
frankly, I'm getting similar access times between my 4x8 CDR and
my HD! Buy a HD case, a 12x CD or CDR SCSI, and a driver and be
happy.

A hot drive is a major disaster for your data. Whether a drive
gets hot depends on how much heat is created and how much air
flow exists (convective cooling can exist even without a fan --
the ST itself is an example). One simple test is to run the
drive for an hour or so and feel if its warm. If it is, I'd add
a fan for security. If it is still cool, then it is fine. I
suspect it'll warm up a bit. :-(

Thanks for the response. Since I want mostly to back up my HD
yet wouldn't mind occasionally copying a music CD compilation,
it sounds like Pro is the better choice for me.

It seems strange that a CD full of .WAV files would be playable
on a standard music CD player. I thought there was something
more to it.

The labeling of the lines is a great idea, though I can read the printer
names in
GDOS, NVDI 3.x and 4.x within Atari Works, just not 5.x. I even installed
MagiC, NVDI (with WDIALOG) and Atari Works alone in my boot drive,
and it still didn't work.

I realise that you did, but the thing is that neither 5.01, 5.02 or 5.03
will work
for showing the printer names. I never said that I couldn't print, only
that I
couldn't view the names from Atari Works or any other program.

Hi Steve,

I will try and put some type of fan in the case. Not a lot of room in
there, but I do have an old external floppy case with a cable change should
work, or maybe I will gut the old A2000 and put all my floppies and
hardrives in there, it's got a huge power supply and fan.

I agree, those are some good prices. I paid about $100.00 for a 40Mhz
FPU a few years ago from Sonnett. A 33mhz was around $65.00.

My understanding is that Hasbro bought all of Atari's "intellectual
property". This covers names, rights, patents on all hardware and software
designs. The fact that they do not plan to do anything with the hardware
stuff means nothing.

Milan Gmbh obtained a license from JTS just before the Hasbro buyout to
develop and distribute TOS. I also understand that Hasbro still has the full
rights to TOS.

> Hasbro brought the games, but what about the hardware?

Hardware was included in the package.

TOS belongs half to Digital Research (or what's left of it, Caldera I
guess), and half to Atari. This makes it difficult for anyone to make a
decision. I can't see Hasbro contacting Caldera to discuss issues like this.

> What is ATAPI? Is this an IDE CD-ROM, or something different again? I only

ATAPI is (very simplified) SCSI using the IDE port. Except for IDE hard
disk drives any devices connected to the IDE port are actually ATAPI
devices. They use a completely different software protocol (ATAPI) than
IDE hard disk drives but are connected to the same port. ATAPI is
similar to SCSI in a lot of respects regarding the command structure
etc. but due to the poor quality of the IDE port compared with a SCSI
bus there are lots of limitations when comparing ATAPI with SCSI.

>like this, after listing the fonts for various resolutions:

NVDI5 seems to have adopted a completely different approach to the assign.sys
file, using the same sys file (PCL.SYS) for ALL the non-pin printers. That
means that the only ways that you can change NVDI5-specific printer types is
by using the add/change printer utility or with the printer.cpx. That's the
way I see it anyway!

One can add a comment against the driver name as you've done Peter, although
it won't help if you've more than one driver set, as I have. Both print via
device 21 and are preselected via the printer.cpx.

Other drivers such as STFax's GDOS driver can be added to the assign.sys file
under their usual name/ID, so that's a bit of old technology mixed in as well!
:-)

So to put into a nutshell, AtariWorks is too old to use the current method of
selecting printer drivers (eg via WDialog or MagiC6), but will still print to
whatever printer driver has been preset by the printer.cpx or the add/change
printer utility, via device 21.

Hope that's not too confusing! :-)

Lonny, when you run the freshup program it should pop up the printer selection box for you to select your printer(s) as part of the upgrade. Didn't this happen?

>I realise that you did, but the thing is that neither 5.01, 5.02 or 5.03
>will work
>for showing the printer names. I never said that I couldn't print, only

Leslie, as you know now AW and many older progs won't tell you the printer name if you're using newer versions of NVDI, simply because of the use of unified printer drivers, and the fact that older progs don't use NVDI's printer selector utilities or WDialog.

Load up a modern prog such as Texel and you'll see what I mean.

you can set up caches for the CD-ROM in ExtenDOS.
I know I can in ExtenDOS Gold, I can't remember vis a vis ExtenDOS.

Hope you can read English (seems so as you post here ;)...):
Assemble & A-Debog by Brainstorm are now Freeware and works well on
Falcon: get it from the DHS site under the "Filesection" (other useful
programs are also there.): http://dhs.atari.org.

> > Je recherche ï¿½galement le fichier DIAMOND.RSC, fichier ressource du
> > programme de BACK_UP du mï¿½me nom (le fichier est dï¿½tï¿½riorï¿½).
Which version do you want?

> Visual Assembler for the Falcon
Sorry Ken but this is only a OO GEM-lib extension for Devpac (also
usable on Assemble with some modifications I guess, needs 030 and AES
3.30 or more IIRC).

You can set a 1 meg cache from a ram disk and set the image cache to
512k or less. Turn off the images on a ST and you can probably use
much less for the image cache, possibly nothing.

Older floppies have jumpers to select the drive whether a or b. or
drive 0 or drive 1. There is also a jumper setting for cable detect.
The jumper setting should be printed on the circuit board. Good luck
trying to figure them out. I had this problem putting a new floppy in
an a2000 and finally decided to trash the amiga.

From what i recall in the press releases, Hasbro only brought 25 of
the patents for games. Atari had over 190 patents when they merged
with JTS. The 25 they sold were due to expire starting in 2000 or
around there.

Try Dirt Cheap Drives (in Texas, USA):
http://www.hard-drive.com/
1-800-475-7476

I just picked up a really nice "deluxe" case for the new Yamaha 4416 CD-RW drive I'm getting (to _finally_ be able to make my own CDs with my Falcon).

The case will accomodate CD ROM drives, or fixed / removable hard drives with a variety of different face plates. It appears to have a nice rugged power supply and fan, SCSI ID switch, RCA stereo audio output jacks, external SCSI terminator and power cord. All for $59.

I can't see any real manufacturers name or model number on the drive, but if you want this exact case, the invoice shows the following information:

EXTHHOPEN EXT. KIT FOR HALF HEIGHT REMOVABLE *C50
HHCASET PLASTIC DRIVE CASE 10.4L x 8.3W x 2.6H*C50
FACEOPEN OPEN FACE BEZEL FOR HHCASE
SCSITERM SCSI TERMINATOR FOR CASE & POWER SUPPLY

Hi All,
In another thread I mentioned the thought of Hasbro hiring all those
great Atari game programmers and updating (inc. TOS). It makes sense to me,
since Hasbro thought enough to even get 25% of the games, that they feel
the name "Atari" still has clout! And where's Gates? To him it would be only a
'game' to challenge soft and hardware 'establishment'!!! If you can dream it
you can create it!

>with one hand in your pocket :-)

Well, I have turned the little coils inside (with a metal screwdriver,
oops!) but to no avail. The horizntal and vertical both don't line up
the pictures (I'm seeing about 4 separate images, all somewhat dim, of
the atari screen flashing). Two images have their far-left screen
positions in the center of the screen, one below the other. The other
two seem to have their edges lined up with the physical left side,
again, one below the other.

I guess I could try some more, but I'm not sure that's the best idea.
I'm not even sure about the polarity of the syncs. There is little to
no info about these monitors.

So would this require some hardware tweaking?

>
>If this doesn't work, then I suspect the monitor(s) is/are faulty. Or
>just possibly the sync polarity is inverted, though this is unlikely.

Definite possibility! I'll try getting another one for testing
purposes. Thanks for the help!

: Ataris but for musical keyboards that use them
: Thanks

All of them have some means of selecting drive 0 (a) or drive 1 (b). The
newer ones have zero-ohm jumpers that need to be unsoldered and moved
over. Look carefully, and with good light. There will be a "0" and a "1"
in small white print near the middle of the back edge of the bottom of the
drive. What needs to be done is obvious once you have found that.

This won't work. None of the emulators support MIDI, emulation of MIDI
timing under windows will be pretty erratic anyway, and where do you intend
to plug the dongle?

Get a cheap 1040ST for next to nothing or a MIDI export.

Granted, many of them are in their 60's, some, like Jay Miner (one of the creators of the Atari 8-bit and Amiga) has passed away.

However, I would have to say that any group of people who can take a computer made in 1985-1993 last this long, continue to hack them to faster speeds and resolutions, and make them go places (internet) that they were not designed or planned to go before... well, sounds like the good programmers are still amoungst us. :)

Hi folks,

Realizing this program is quite old, I'm hoping someone out there still has knowledge of this. I'm trying to get my ST to act as my hard drive for my Atari 8-bit computer. The program I have found is "800XL DeeJay" which is a cute little program that allows an 8-bit to access the ST via an SIO2PC cable.

Got the cable, the two computers, and I've tried various configurations, but still the 8-bit does not recognize the ST as a disk drive with the 800XL DeeJay program running. What are some things to keep in mind when trying to get this to work?

And if someone would be kind enough to walk me through this, my E-mail address is : drclu@swbell.net

Thanks!

Hi !

AFAIK *.atr is a binary data format used by Atari-8-bit
Emulators (such as X-Former, Atari 800 or XL-It etc).
In each of that files one whole disk is stored.
So, to use them you need either an Atari-Emulator
or some other tool.
I think in principle it is possible (with the right
hardware) to write the atr-File back on the 'real' 5 1/4-Disks.

BTW, maybe you should try posting in some 8-Bit-newsgroup :)

Speaking of old Atari programmers does anyone know what's become of Chris Crawford? After Atari he wrote some highly acclaimed world domination simulation for the Mac I believe. And then I remember reading an article in a magazine about him that said he was in the process of writing the next super duper game. That's the last I've heard of him.

in short. without a Marpet board. no.
but you could swap the power supplies! put the 520's ps in the 1040.
the 1040STe memory is in SIMM chips which you can 'snap' into place,
the 520's memory is soldered in (unless you have a Marpet board)

Thanks, Derryck.

Now, where can I get a copy of Texel 2.00? I checked with Systems for Tomorrow here in the United States, and they say they can't get Texel 2 until Systems for Tomorrow releases it. They suggested I contact ASH directly for the German version. I went to their web site, but there doesn't seem to be an English version of the site.

I'm open for suggestions.

Thanks.

Check out the Com-Port, in which you plug in the SIO2PC cable. Some ST computers (and especially Falcon computers !!) have to be modified to work properly with XLDeejay and SIO2PC. Since I do not own any ST/STE/TT/Falcon computers, I do not know which sort of modification has to be made... but wait, there was a TT user asking for a good XL emulator, maybe you can give him the XLDeejay...
And finally I hope there is anybody who can help with the XLDeejay problem (and modification) soon... greets - Andreas

2156. C-Lab Falcon MK-X and AfterBurner 040

Help! I'm trying to get an AB040 installed in my Falcon MK-X, and it's
not working. The installer say he has done dozens of Nemesis and AB040
installations into regular (stock Atari) Falcons, but not into an MK-X.
If there's anybody out there who has done so successfully, *please*
write me at msh (at) qadas (dot) com ASAP! Thanks very much in advance.

This 520St has an EXTERNAL power Supply, so I wish it was that easy. I called Best Electronics, and Brad said they are not interchangable, but he 's got'em for $75.00 and I can install it myself. I might do that, even though it is a little pricy.I could use the extra memory especially on Notator. However I might open it up and see whats there any way now that you got me curious!

Hi!

Since I have never owned a Ste, only a STfm in various ram sizes I have one simple question: Are all STe SIMM card uppgradable? I heard that some STe have SIPP (or something like that!?) card instead. Does this matter if I just replace the ones in the SIMM slot with four 1 Mb SIMM cards to get 4 Mb STe.

I uppgraded my STfm with a Frontier ram upgrade board to get 1 Mb and it works beautiful.

Oh, one more thing: Does all the STe have a RF modulated video outlet (I'm unsure if it's the right word?) like the STfm have? It reallt doesn't matter since I can connect it to a scart TV instead from the monitor outlet.

Well, I guess that is all for this time...

I think amongst atari fans, the STacy is a bit of a collectors item,
along with the STBook. These systems are impossible to find, but when
you do, they cost too much, even if they are damaged! I bought a much
more powerfull Apple Powerbook 180c (030 processor with fpu) for around
ï¿½150, you wouldn't get an atari laptop for double that!

You got me thinking with that one. He published a good article over three years ago, "Computer Games are Dead". For those of us who started out with the Atari 8-bit games, like Eastern Front 1941, it was a good read. I still had it on my computer. I opened it up, pulled out his company name at that time, did a search on Yahoo, and viola - http://www.erasmatazz.com/. Check it out to find out what he is up to these days. If you want to dig in deep, check out the library.

I am still amazed at what programmers like Chris accomplished with computers back then.

I am posting this on behalf of soemone who doesn't have access to this
newsgroup:

I used to be an avid
Atari fan starting with my 400, then 800, and I now have stored away
two 800xl's, two 1050 disc drives, an original ST with external drive
and loads of software for all of it.

For personal reasons I no longer have the space for it and am loathe
to throw it out :-(

Do you know anyone who would like to take it off my hands for free??

Of course they'd have to collect.

Please reply to p.mcroy@zetnet.co.uk

I can't give much support for the old shareware versions of HPP (source
lost + lack of time). Please note that Cyberstrider is not the
distributor anymore, English versions can be purchased from me. Current
English/American English version is 3.03.

2181. More Memory on a 520ST?

Newsgroup: comp.sys.atari.st
Date: 2000-02-10 00:00:00 UTC
From: tconrardy@hotmail.com
Message-ID: <qsso4.794$B96.17269@nuq-read.news.verio.net>
Source record: 65840

Hi All:

My 4 meg 1040Ste's power supply just went out, so I got out my spare 520ST
that I was using for games. Most of my Midi stuff works on it
(including Notator!) It is a 1 meg machine.

I was wondering if I can use the memory chips in my 1040STe and put
them in the 520 for the extra memory .

Thanks in advance.

Tim

2182. emulators and cubase2 crash

Newsgroup: comp.sys.atari.st
Date: 2000-02-10 00:00:00 UTC
From: guillaume letetu-renexter <Guillaume.Letetu-Renexter@renault.com>
Message-ID: <38A25796.FD80D77F@renault.com>
Source record: 65841

I tried emulators on my pc (with win95) in order to use old atari music softwares like cubase 2 (I have not enough midi ports on my 1040STe to pilot all my expanders...) and I didn't manage to run it correctly:

-PacifiST v0.49: Cubase2 runs correctly but no midi data is sent by the midi out port of the MPU401 (win95 problems?).

-Gemulator2000: when I execute cubase.prg, it crashes the pc (what a nice blue screen...).

Have I missed something ?

Thanks.

A 520 ST has 512K, not 1Mb as standard. Therefore, if you are sure that the machine has 1Mb, then there is probably a RAM expansion board inside. Open it up or use sysinfo to find out for sure:

http://bales.online.fr/atari/files/sysinfo.zip

If you are using it for games, there is no point in going beyond 1Mb.

>
> I was wondering if I can use the memory chips in my 1040STe and put
> them in the 520 for the extra memory .

If there is a RAM expansion board inside, then there were several sorts. Some had fixed RAM just to upgrade a 520 to 1040, others had SIMM sockets. The only way to be sure is to open it up.

Wouldn't it be better to use the power supply from the ST inside the STE ?

with programming experience in 6502 assembly language. They had great
concepts in the 70's, but games are much more complex nowadays and are coded
in C++. There is no more talent, games are designed by commissions against
specifications given by marketing. The old Atari days are gone for good.

Problem I had sending a JPEG to someone useing other than Newsie seems to be
resolved (not sure which program they use). Some got the JPEG UUE encoded OK.
The one that did'nt, switching to 'Force MIME' fixed the problem they had in
decodeing! Note here that I don't mind having to manually try different
settings to get Newsie to cooperate with other mail programs. Hell man, it's
free!!! Note also, I'd pay for an up to date commercial version of Newsie
(reasonably glitch free). Either way, thanks John R. for your work!

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

Click for WebSite!

(Update: 02/10/2000) I've just added more to my ST Software Catalog and
I've added considerably more to my Hardware Catalog for the Classic 8
Bit as well as adjusted prices in that Catalog. Their are some items in
my 8 Bit Hardware Catalog I've just added on a trial basis. If I can't
sell them, I'll get rid of them to make room for more stock. These
Items are mainly the ones marked AS-IS or untested.

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. So checkout what's new on
my WebSite. In Fact, check it regularly as my Catalogs are updated
regularly. Customer's are served, first come, first serve! I have 6
different Catalogs, and my SoftWare Catalogs are my largest. They have
the biggest Byte Count. You should see my inventory! I have TruckLoads
of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference
Material for the Classic Atari 8 Bit & Atari ST! And remember, if you
can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to
meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, March 9th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. We're trying to rebuild our club so we're looking for Atarians who wan't to get involved in supporting other Atarians. It's pretty easy, actually. Just open the case, remove the shielding so you can get a clear view of the motherboard. Look for a socket near the front side of the board that's empty that looks the same size as your FPU. Match up the notch at the top of the socket with the dot at the top of the chip and press it firmly into place. There you go! It should work fine! Test it with GEMBench or some other test program that looks for an FPU.

> You won't see modern software in these archives, only old games
>and mostly budgie games which have long been dropped by their original
>authors, in some cases, the patents or trademarks of many of these titles
>have no owner.

Well Budgie UK ceased to be a few years ago and all their software was
placed in the public domain.

I do know what goes on Automation, BBC, Pompey Pirate... disks. They all
boast the latest software cracks., and I should know what I'm talking
about as I've belonged to a few menu groups! My Handle 'The
Mockingbird'.

>
>The artwork and demoscreens on some of these disks are truly incredible and
>are sought after as collectors items.

Yes some of the artwork, if you call it that, was good, some was more
pornographic with reset pictures of porn, and I'm not talking page 3
stuff either!

Parents get hold of games for their kids, and quite a few where shocked
to find these pictures accessible by their children.

>
>The fact that there were over 6000 titles available on the Atari is pretty
>amazing, and the fact that they have been burned onto a cd will ensure that
>these titles live on for generations.

So all I have to do is copy, and crack if necessary, all the commercial,
or old commercial, that I have got and from the internet stick it on a
CD and flog it. That's collectable is it!!!

I've got software in the box, with instructions, some with COLLECTABLE
posters and aren't prone to problems cracked programs can have.

I've seen lots of so called hacked and packed programs, even on the pd
scene. For one packing doesn't work for every program, I've come across
many programs that stop working later on in the game. Some fall at the
first hurdle on STE's.

Now as there isn't much NEW commercial games, I can safely say that new
stuff would be around 1993+ which comes under the OLD heading for
menu's.

Having PD stuff, The Golden Dawn is one that comes to mind, the advanced user, let alone the average one, will have a problem removing ONE pd program off the disk unless instructions on doing so is given.

On several occasions they aren't even runable UNLESS you use the menu system, and some half meg games also now required a 1 meg machine!!!

I could go on and on..

It's a simple plug-in job. Just be careful to align the
chip's bevelled corner with that of the chip socket
(under the power supply). Forcing it in any other way
will cause damage to the chip and/or socket.

If you contemplate further down the line installing a
CENTurbo II, make sure the FPU chip is rated 33 MHz
minumum (otherwise, 16 MHz will do), because the CT2 clocks
it at 50 MHz and anything less won't work reliably. On CT2,
the FPU will have much greater performance becase of
the higher clock speed (more than 3x) and 32-bit access
instead of 16-bit.

It won't work here either. I would say please be carefull with that thing.
In not 100% sure but right after I'd done several tries I found that
Okami's onews.def was destroyed. Very likely it was more or the less my
fault -I probably try the patch when Okami was in memory- but nevertheless
it shouldn't do such things.

I've been having the same problem, it seems when I "really"
need or want to access some specific site, CAB just cannot do it.
It's getting worse instead of better. Being the rocket scientist
that I am, I have switched to the MiNTNet version of the CAB.OVL
with SSL, however it has only solve a few minor problems on some
pages. I have to admit I was suprised it worked at all, but
it still isn't enough.

I to would like to some progress in this area, and with an open
stack.

Yes, I had a perfectly working 5.01 setup, ran the freshup reselected my
printer (you would think it would know this already?) and so on....
rebooted only to find out that not one prg would print. All the cpx's and
such were in place, nothing missing. Tried like heck to select a printer
in the CPX, but none showed, only the image driver. It was after
installing the 5.03 freshup 2 or 3 times I decided to try the INSTPRNT
program, and bingo it fixed it. I have no clue why, only that it did.

The Tony Hawk? Like the skater dude!

Anyway, MIDI adapters depend on the software you want to use.
For example Stienberg made the "MIDIEX and MIDIEX+" for Cubase,
C-Lab made a box (forgot the name) for Notator or Creator,
Hybrid Arts made the "MIDIPLEXER" for their line of Editrack
software.

I am not aware of any "universal type MIDI adapter" for Atari.

Yes, although the memory of the 520ST is pretty limiting. Because of all
the auto folder and accessories you will want to install:-).

Try http://www.umich.edu/~archive/atari

Here you will find ADHI 6.01 which should work. You can check out others
ther as well. Finally there are others available at various FTP sites, and
Web Pages.

HSMODEM doesn't increase the serial port above 19200. Anything above this
is wasted. 28800modem will be limted to 19200.

The ST requires a modification to go above 19200.

This mod can be found on the Atari Launchpad.

Tools | Options | Send | Plain text settings (mail or news) | Message format - choose between MIME and UUE.

Even has the ability to split UUE'd binaries into sections and to combine sections back into binaries.

As to why OE users have difficulty with NEWSie's UUE'd attachments I don't know the answer, but I'd suspect NEWSie.

I've recently had an email conversation with someone who was having trouble sending MIME attachments from NEWSie to a Pine user. Conversation arose from him forwarding an attachment to me from NEWSie which Outlook (not OE) couldn't recognise as NEWSie hadn't included the relevant MIME header information, ie broken MIME implementation. Ironically I suggested he tried using UUE when sending to the Pine user, so if UUE is broken in NEWSie too there isn't much hope.

FWIW Okami's MIME implementation is pretty hot.

I don't advocate piracy, but these people have saved a valuable piece of atari history and have helped keep interest up in the atari platform through emulation. You won't see modern software in these archives, only old games and mostly budgie games which have long been dropped by their original authors, in some cases, the patents or trademarks of many of these titles have no owner.

The artwork and demoscreens on some of these disks are truly incredible and are sought after as collectors items.

The fact that there were over 6000 titles available on the Atari is pretty amazing, and the fact that they have been burned onto a cd will ensure that these titles live on for generations.

2217. Any good web browsers soon?

Newsgroup: comp.sys.atari.st
Date: 2000-02-11 00:00:00 UTC
From: nameerf@flash.net
Message-ID: <alMo4.13987$wR.960009@news.flash.net>
Source record: 65787

Ok, so I just got absolutely frustrated with CAB tonite. Are we ever going to have a web browser that actually works for modern internet purposes?!?!?!

I love my Falcon, but honestly, it sucks as an Internet machine. My wife and I got information in the mail about renewing financial aid for school. Unfortunately, instead of the usual forms, everything is being done online now. Well, CAB doesn't work for it at all. First, it requires a secure browser, meaning that unless you're a rocket scientist who can understand the inner workings of MintNet, you're stuck there. Second, the buttons on their form site don't go anywhere under CAB. The button appears dark, but CAB doesn't even attempt to go anywhere. So we'll have to find a PC somewhere...

The University also does everything online now. At its web site, you can choose either text or graphics based page. The graphics-based link doesn't redirect correctly, bringing up a file not found error. The text based link brings up a dialog box. On PC's, it gives you some information that you must enter into it:

"Please enter your student-id followed by the following number:xxxxx"

CAB however (at least with the current CAB.OVL's) displays its own pre-written dialog, meaning that you aren't given the number, therefore you can't enter it. Once again, have to find a PC somewhere...

This happens on nearly every serious site that we need to go to. It either requires Javascript or needs some other feature CAB apparently doesn't have. So are we ever going to get a good browser with everything the web needs, or are we stuck with archaic browsers that PC browsers outdated years ago?

I'm really tired of this crap. I'm not about to give up on my Atari, but I don't have room on my desk (or desire) to get a PC. I hope someone gets their butt in gear and develops a working modern browser soon. I just can't spend the time required hunting down available computer labs on campus.

Sorry for the venting. Anyone willing to get going on a browser project instead of just talking and arguing about it? Any suggestions welcome, also.

Yes, some of the older STEs use SIPP sockets instead of SIMM.

SIPP and SIMM are compatible, but the connections are different. SIPP
modules have pins soldered on their edges which are inserted into holes,
whereas SIMM have edge connectors. There are SIPP to SIMM adapters. If in
doubt just open up the machine to check. It's better to get a machine with
SIMM sockets, because SIMMs are more easily available.

Yes, except France where we have SCART since 1981.

Please send the reference of the international law that states that.

This is a "rule" that pirates write down as a "disclaimer" but it has no
legal value. Where I live, you are entitled to one private backup of your
software, as long as you own the original.

```
Right, but this stuff was all downloaded from the net and bunged on a CD.
It's not like he converted himself these 6000 titles. And he has the nerve
to ask 5UKP for it.

Pirate software are not collector items. A collector will be interested in
getting the boxes and manuals, not disk images.

You can use any modem. A modem is a modem. You'll need the same cable that comes with a PC modem.

Well, remove the STE PSU, drill a hole in the STE case, build a connector to
the external PSU (not sure what the pinouts are, but this can probably be
deducted). Then you have some extra space inside for a 3.5" IDE drive !!!

The MiNT-Net CAB.OVL does SSL (secure socket layer) already, if
compiled with the proper option enabled. Juhani Sivusalo made
a pre-compiled one, which you can find on:

http://www.highlandsun.com/hyc/

Faster JPEG loading, PNG support, several HTML bugfixes, better
clipboard support for Minix/etx2 partitions. That's about it.

Unless you hack it, the hardware is restricted to 19200. 57600 is possible
with the right software and the right hardware-mods. 38400 is realistic,
but again with hardware-mods.

The zip is crappy and slow. At least the syquest will run at a respectable
speed. You are better off getting a Jazz, although I cannot personally
vouch for their sturdiness as mine has crapped out after it's warranty died,
actually the warranty was still effective, but I lost the reciept and Iomega
would not return it without the reciept, and their return policy in general
sucks.

Has anyone tried the new orb drives

I understand everyone's frustration - two year old programs that were a two years out of date when released really don't make it. The plain fact is that older Atari models do not have the processing power needed to run a modern web browser no matter how well it has been written. However, if the Milan project really gets off the ground - they will have to provide a browser that will compete with Netscape and IE. Without good internet support that project does not have a chance of making it. I really hope they are sucessful as I HATE the Windows interface.

So for now I use my TT for e-mail/news and general browsing with CAB 2.7. If I want to order something on the "net" I fire up the PC :).

2233. Adding Another Hard Drive

Newsgroup: comp.sys.atari.st
Date: 2000-02-12 00:00:00 UTC
From: taj16@dreamscape.com
Message-ID: <sa9m3bm8fo818@corp.supernews.com>
Source record: 65679

I have a Mega ST4 with a Toadfile 44 hard drive, a gift from a longtime friend. The drive was purchased in 1990 and used heavily for about 5 years, then lightly for two, then not at all until a little over a year ago, when I got it. I've used it fairly heavily while I've had it, and now I'm beginning to worry about it. After all, components age, lubricants dry up, and bearings wear out eventually.

Another friend has given me an external Syquest 200Mb Removable drive originally designed for use with a Mac which he says is also able to read/write 44 and 88 Mb carts, but can't format them. This is a SCSI drive, with internal SCSI termination and two external Centronics-type 50-connector SCSI ports.

I'd like to add this to my Mega system. I've always understood you can connect up to 8 SCSI devices to a single host adapter, so I'd like to use the ICD ADSCI Plus adapter (The one with the clock) that's within the Toadfile. However, when I opened up the Toadfile, I saw but a single 50-connector ribbon cable between the host adapter and the HD, with no unused connectors. I also saw a knockout in the back that looks like just the right size for an external SCSI connector.

I'm assuming I need a different SCSI cable inside the Toadfile, a panel mount adapter to some sort of external connector, and an external SCSI cable for the "new" drive. Could anyone give me an idea of precisely what to look for, and a good place to look? Also, since I have an empty slot for an internal device in my Toadfile case, would it be a good idea to buy a cable now that could be used with that slot in the future? And if so, would I need to terminate the (for now) unused cable?

Any help would be greatly appreciated.

2234. Newsie Email Signatures

Newsgroup: comp.sys.atari.st
Date: 2000-02-12 00:00:00 UTC
From: taj16@dreamscape.com
Message-ID: <sa9m49hefo821@corp.supernews.com>
Source record: 65680

I've been trying to append a cutsey signature to some of my email using Newsie 0.94, and so far it's been a total failure. I put a signature file together with Edit Plus 3.12 and saved it. Then, I configured Newsie to find it using the "Signature Preferences" item of the Preferences menu, and saved it as the default. When I look at the Signature Preference I see the proper path and filename, and the first few lines of my signature file, so I assume that part is correct. When I sent me email, I X'ed the box marked "Append Signature." Nothing. I tried X'ing the box both before and after editing the email--neither way worked.

What am I doing wrong? I'm using Edit Plus 3.12 as the external editor, and other features workjust fine with it. I really don't think that's the problem.

I can live just fine without the ability to append cutsey signatures to my email. In fact, I expected to soon get tired of it and go back to dull and boring after a while. It's just that it galls me to not be able to figure out something that looks so simple to do. I just know I'm gonna feel stupid when this gets solved.

Not sure if it's what you're looking for but I've used a product from
JLCOOPER called the NEXUS with my ST4. Has 8 MIDI outs switchable between
3 (A/B/C) inputs. I had it working in conjunction with the PPS100
(also JLCOOPER), modules, keyboard, etc.
It broke down twice in about 5-7 years (once from a lightning power
surge). However, most MIDI stuff have THRU ports but chaining to many is
supposed to cause signal loss. But if you keep tha chais short, it's ok
(without a MIDI distribution box like the NEXUS). In other words, branch
out from a module to 2 others and those 2 to 4. Hope I helped.
John G.

TJ,
Although there's no problem here useing Newsie94/Everest with regard to
Sig files, have you tried another editor? Also, once in a while I re-load a
Newsie back-up of needed files (in case a glitch got added somewhere).

Yes, it is (in Germany). I've upgraded it.

> Faster JPEG loading, PNG support, several HTML bugfixes, better
> clipboard support for Minix/etx2 partitions. That's about it.

BTW, I've made some tests with the new jpeg_png.ovl and the previous
jpeg.ovl: the new one seems about 10 percent slower than the new one on
JPEGs, both on regular and progressive ones.

Bye,
/Pascal/

Miguel,
I've used an ST4 (still hooked up and kicking butt) since '87! Although
slow saving and loading files (especially without a hard drive), it serves
well pumping MIDI data through 5 modules (JV-1080 being the latest),
D10 keyboard, Tascam TSR-8, etc., etc! Price for an ST4? Maybe some else has
one up for grabs here or check E-bay and other Atari auctions.
Good luck though.....Atari was made for MIDI.....

>-Tom

What Mr. Bales said. +

Any modem will do. As long as its external for your ST. Even 28,800 modems and larger work. You are limited to 19200 without a Hardware mod so its roughly 30% faster than 14400 and 30% slower than 28,800.

You will also need HS modem to operate at faster speeds 9600+.

Hope this helps and go to Nicholas FAQ page on his Signature. Excellent place to start.

If you are interested in the hardware mod, go to http://Launchpad.atari.org

Later Brian.

Again many thanks for your work on this - Hope you've recovered now ;-)

A question. Egroups allows uploding of files to the list vault but CAB
apparently doesn't support "browser upload". Is this a missing
implementation within CAB itself or is it the OVL which handles this?

Best Wishes
Sean

|>|Yes, but the ST is limited to 19.2Kbps. Therefore, anything above a
|>|14.400bps modem is a waste.
|>
|>Higher speeds are available with HSModem.
|
|HSMODEM doesn't increase the serial port above 19200.

Funny, I thought the opposite. Certainly the documentation says:

FASTINT:
DRVIN.PRG is able to modify the timer interrupt of the TOS to achieve
57600Bd on MODEM1 on a 8MHz-68000. Even on MegaSTE, TT and Falcon the
modification can provide some enhancements. Under MagiC the madification
will never be done because MagiC (version 2.0 and newer) has already a
"friendly" timer routine. FASTINT should be switched off for
experiments with other operating systems or if mystic errors/behavior
occur.

Function (for interested users):
I discovered it's enough to call the routine (GEMDOS-timer) in NEXT_TIM
(negatvie LineA variable) with an IPL < 6 to enable 57k6Bd receive with an
68000/8MHz. So I insert a piece of code to set the IPL down to 5. That's not
without any risk but only creates problems when other programs do such hacks
too.

|I've been trying to append a cutsey signature to some of my email using
|Newsie 0.94, and so far it's been a total failure. I put a signature file
|together with Edit Plus 3.12 and saved it. Then, I configured Newsie to
|find it using the "Signature Preferences" item of the Preferences menu, and
|saved it as the default. When I look at the Signature Preference I see the
|proper path and filename, and the first few lines of my signature file, so
|I assume that part is correct.

It is generally considered impolite to use large signatures. Given
the fact the your signature file must be quite a size ('the first
few lines of my signature file') perhaps it is no harm that Newsie
refuses to handle it.

-rw-rw-rw- 1 root wheel 59179 Jul 4 1999 a114-13.jpg

1) Cab 2.70
~~~~~~~~~~~~
Loading time: 3 min 18 sec
```

2) Cab 2.80
~~~~~~~~~~~~
Loading time: 47 sec.

3) Wensuite 3.30c
~~~~~~~~~~~~~~~~~~
Loading time: 17 sec
only 2 sec if loaded from cache (with Cab there is
no different between loaded from cache or not)

4) Draconis 1.63: No way I could load that page. Draconis just crash when
it try to load the prog. jpg's

The speed different between Cab 2.7 and 2.8 is quite amazing at least when
the pages contains lots of prog. jpg's.
On smaller pages the different is not that significant.

It also amazing that Wensuite loads pages so damned fast.

- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working SONY SAT-A50 DSS Satellite Receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

2262. "M", RealTime, and Tunesmith (demo) Now Available

Newsgroup: comp.sys.atari.st
Date: 2000-02-12 00:00:00 UTC
From: tconrardy@hotmail.com
Message-ID: <JFhp4.1010$B96.23957@nuq-read.news.verio.net>
Source record: 65708

Hello All

Some exciting news for Atari MidiSts:

"M", and RealTime are Now FREEWARE and available at my site.
Thanks go to David Zicarelli and Eric Ameres, the original programmers
for M, and Eric Ameres , the original programmer for RealTime.

Also Jim Johnson has allowed me to have the Demo for Tunesmith, so I
have a page for that as well, along with a set of midi files created
on Tunesmith you can load into any sequencer to play with.Perhaps soon
Jim will have a "real" version for us, but time will tell.(I keep
hounding him)

A word of note for the M download. It is a "liberated" version.However
both programmers have allowed this version to be used as a download,
so no problems there now that it is out in the Open. looks like the
MCA was doing a service in the long run!

RealTime is NOT a liberated version and is the "real" thing! (pun
intended) A fantastic Algorithmic Sequencer.I have a Snapshots as
well as a tutorial, so please check it out. There is more to this
program then meets the eye(and there is a Lot to see!)

Here is my site:

http://atari.atlantis-bbs.com

I would recommend the Yamaha PSR series, as it is General Midi and
good quality, and not a whole lot of money.(Under $200.00 American
dollars) However the Sounds are NOT editable, so if it's a
Synthisizer you are looking for, that is another story. Go to any
used or even retail music stores and see what is there in your
price range. you can always dream! Some od the "old" FM Yamahas are
now pretty cheap, and good quality as well, but not General midi.

That's the problem, only 1 of my instruments has thru. My Akai AX-80. My Korg Poly-800 and Roland TR-707 don't, that's my problem. My only solution so far is to use my 707 as the master, and sync with the ST then have the ST's out go to the Akai, and then use the thru to the Korg. But, I'd prefer to be able to sequence the whole thing from the ST... oh well, use what you have.

There isn't much, even in Atari's own service manuals, but here
is what I could find:

switch no. purpose when on
========== ===============
7 enable 1.44 mb floppy formatting on Newdesk

That's it. Other switches appear to have no specific purpose.

Hi Dan!

Many thanks for your work on this! This is a problem that I've been up against for some time, ever since eGroups/Onelist updated their site, and I got cookie errors with the new site. As I moderate the Cheshunt Computer Club mailing list from there, I had to go to an Internet cafe to do various tasks.

I only wish I had written to you before, like Sean Barbieri (another Cheshunt List member) did, but it's all back working now. I even considered going to Iconnect, but with money a bit tight I couldn't afford that route, with no freeware emailer, unlike with Sting! ;-))

Thanks again for this update, you've even saved me money!! ;-)))

Cheers!

James

>

In old PC's ie. those with twin floppies jumpers weren't used. Rather than have to set jumpers to select drive 0 or 1, the second drive cable had the wires crossed over. Thus although each drive was set as drive 0 when drive 1 was selected the signal was presented at the drive 1's drive 0 pin & drive 0's 1 pin as drive 1 so correctly selecting the drive. that may be why you don't see jumpers on the drive. Drive 0 & 1 selection lines are readily available on ST's, just make sure the the signal goes to the drive 0 contact on the edge connector.

Hi Jerry!

Yes there is! I'll send it to you in a mo'! If anyone else wants it too,
email me!

Whilst we're on this subject, (and as you're the Support Site for mICQ)
you know that you can run mICQ from the login.bat, if you use Spawner?
This can be very handy too, especially if you have friends with PCs who
have ICQ which does this automatically on login. I've also got it set
currently to load Newsie too, though I may change that, as it takes a
while to load, and it would be cheaper to pre-load that before dialling!

Cheers!

James

Thanks for the Menu. Anyways, I don't suspect NEWsie as both my friends used OE and one could get the attachment unzipped and the other received 0byte file when unzipped. It was in their settings on their end.

UUE is UUE, NEWsies encoding works with all the UUE programs I have. Really slow on an ST with NEWsie.

Unless something has changed with UUE or NEWsie was doing it incorrect, it shouldn't work on my other UUE programs. Its easy to get Operator error on a PC. I asked my friend when I first had the problem a year ago, do you have UUE enabled and he stated that PC programs do these things automatically. Clearly an incorrect assumption.

After a year this same person has learned to set plain text settings.

I can't comment on your Mime encounter as MIME completely confuses me. I don't know much about it, however any information people wish to put forward would be appreciated.

Yes, imagine this on a stock ST with a 500k Jpg. Binaries are tagged
in later versions of NEWsie, but still appear in the editor. I figure this
is the result of using different editors. If NEWsie could display the two
files it creates after UUE this would be acceptable. The Binary as an ICON
or Symbol and the Text in the editor alone.

If some get it and others don't, isn't it reasonable to assume the problem
is at their end? In my case both users used OE on PC and got the EXACT
problem described. Unzipped to a zerobyte file. I send many Binaries to
many different users. I have only encountered one problem and do not
consider the problem is at NEWsies end. Sounds like user error. Now a User
error can occur on NEWsies side as well.

Note here that I don't mind having to manually try different
>settings to get Newsie to cooperate with other mail programs. Hell man, it's

>(reasonably glitch free). Either way, thanks John R. for your work!
> John G.
>

Watch your speak!!! Pay for Atari Programs:-). Really I enjoy NEWsie alot.
I am comparing it to other Atari Programs. Some are prettier, some are more
refined. NEWsie can look cludgy by comparision. I have a handful of
problems with NEWsie. But NEWsie is the program I most often use. I would
like to see features from other programs implemented. Features found on
other platforms as well. But even someone who has never used a NG can
figure out how NEWsie works.

Minor Upgrade. Doesn't support anything Mike or Lonny or the rest of us for
that matter require.

I don't believe it is faster with JPG and that is just a marketing
illusion. I don't think it incorporates the DSP into the jpg overlay for
Falcon users, and this would be the biggest increase attained in speed for
a Falcon user.

Edit plus will work just fine. Save your signature file in edit plus.
Then use the signature file from preference menu and click through the file
selector to where you have saved your Sig file and click ok. Then X the box
to add the sig selection like you have done previously.

Now Save your preferences under the preference menu. Exit NEWsie and reload
NEWsie with the new settings. This should get you working.

Hello...

ATM I've got an STE which i haven't used in years (I can't even remember if it's got 2 or 4 MB in it... i'll need to open it up), and i'm about to (hopefully) get hold of a STFM and an ST that some peeps are chucking out... because i've not used atari's for years i've got a bunch of questions:

* What kind of HDD's do they use (I've never seen the connectors on anything else) and where can I get them (and how much will it cost)?

* Can I network them?

* Even better, can I network them to the 10baseT network I have already?

* What use is an ST without a HDD or an FDD?

* What's the M in STFM stand for? (iirc F is for FDD)

* Can I rig them up to better monitors (the atari ones seem to be 2x 1224's and a 224 (i'm not sure on the last one))

* Would it be easy to get m68k linux onto them?

* How easy (and expensive) is it to get them on the net?

Hmm, those should do for now ;)

Sorry if these questions are covered in the FAQ, I couldn't find one...

Yep, it still crash on very rare occassions but it's not Cab that crash
but the OVL. Cab itself is rock solide. Pages with Java or Javascript
doesn't bring down Cab. Most of the time you'll see the starting page but
ofcourse you'll not be able to follow the links and so.
Try to view the same pages with Draconis 1.63 pro which according to the
author supports Javascript and you'll see that Draconis most of time will
crash whereas Cab will stay alive.
I've three Atari browsers here, Cab 2.8, Wensuite 3.30c and Draconis 1.63
and I can tell you that Cab performs much better then the rest. Sure
Wensuite is much faster but because WS still lacks widely used tags lots
of pages looks awfull. I prefer a slower browser which renders the
pages very good above a quick browser which renders the pages bad.

Draconis is like it is right now a real disaster. Not worth one single
penny. Sad but true. I hope that the Milan crew doesn't include that
browser as standard browser in their software package.

>any way now that you got me curious!

You obviously have a very early 520 ST - most likely with TOS 1.0. In
that case I think your best bet is to look out for a used STFM or STE
which I am told can be picked up in Thrift stores etc for next to
nothing, take out the power supply and fit it into your STE. It's one
plug and 2 screws, after you take the top and shielding off. It is also
possible to connect an external PC power supply with a suitable adaptor
plug (which you'll probably have to make yourself), though this is
naturally a less elegant solution, specially if you are moving the
computer about. Both ways should be cheaper than Brad's, though his
stuff is usually very good.

2288. NVDI CPX program and Magic

Newsgroup: comp.sys.atari.st
Date: 2000-02-13 00:00:00 UTC
From: ebaiz@skyenet.net
Message-ID: <38a6e4d3@news.qtm.net>
Source record: 65600

I recently got Magic for my Hades. I have gotten it to run most everything and now I love it. The one thing that disturbs me is that I cannot get the NVDI printer CPX program to come up. You know, the file that lets you change the printer driver, adjust brightness, select paper type, etc. It loads into COPS, but I just cannot get it to come up on my screen. Anyone have any thoughts to the matter???

>And Thanks to Dan and Oliver, CAB has come a long way. So could the OVL be
>further improved to quell a few cmplaints in this thread?
> John G.

Well I must admit I haven't followed the whole thread. I can go
over a few things I gathered.

1. Java, not likely maybe possible in some odd sort of way where
CAB is made a slave to the OVL and not the other way around. I'm not
certain this would be possible and it would be a major bit of work if you
could.

2. Javascript. From my understanding of it's function. See 1
above.

3. SSL (and/or) TSL. Possible but the law stands a in the
way. I'm looking at ways I can support the bare minimum (legal maximum in
the US) of SSL/TSL. Since I don't want to face federal charges. Contrary
to what some people would like to believe. I'm certain if the federal
government were to ask Mr. Chu. He did not put support for SSLeay into
his OVL. This was done by another programmer in scandinavia (which has no
laws on the subject). If you look at the link on his page, it's not to
his site. It's actually to the version that resides in scandinavia. So
if you download it from there you are actually getting the file from
somewhere other than the US.

3.cont. Now if and when I get SSL/TSL in place I would not
recommend using it for credit card transactions. As I'll be limited to

the US limit, which is the same as the level of encoding for DVD's and we all know how secure that format is. (Actually to be honest even at it's highest level I'm not real big into sending credit card information to a web site. Even if it gets there with no problem, many are routinely hacked and the credit card numbers stolen and distributed out across the net. Just me though.)

Were there some other questions on the subject that I missed?

CCAG '2000
Classic Computer And Gaming Fair 2000
Date: June 10 2000

Location: National Guard Armory
Route 57, Lorain, Ohio, USA (Just 25 minutes West of Cleveland)
Cost: FREE! For both vendors and spectators!

Setup: June 9, 2000
4PM-10PM For Inside Vendors and User Groups only
Fair: June 10, 2000
9AM-6PM
"Flea Market" Vendors can start setup at 7AM
Systems: All Classic computer or gaming system: Atari, Intellevision,
Magnavox, Commodore,
TI, Amiga, Timex, ADAM, Nintendo, Sega, etc.
We will try to accommodate all late comers, but the deadline for inside
table reservations
is May 9, 2000 one month before the CCAG.
Donations will be gladly accepted to help cover expenses. Remember, this
CCAG is free
to both the spectators and vendors. We are located close to several
fast-food restaurant,
no refreshments will be served at the CCAG.

Please stay tuned a URL will be made available shortly with a map,
lodging information and
more.

For further info please contact:

Didn't they raise this to 64-bit for US and 128-bit for export?

> I'm certain if the federal government were to ask Mr. Chu,
> he did not put support for SSLeay into his OVL.

He put support for it, but did not distribute binaries, so it
remains legal. The code to use crypto (if found in the compiler
paths) is there, but the proper option must be declared when
compiling and SSLeay must compiled and installed before building.

> This was done by another programmer in scandinavia (which has
> no laws on the subject).

All Juhani did was find a source for SSLeay libraries outside
USA, then compile the OVL with the crypto enabled following the
instructions.

To confirm, Finland indeed has no laws restricting crypto. In
fact, this country encourages both corporations and individuals
to use crypto in their communications, especially on the web.

> If you look at the link on his page, it's not on his site.
> It's actually to the version that resides in scandinavia.

Correct.

I can sympathize with your frustration. Personally, I'm hoping
Dan will be able to implement SSL and Cookies. That said, it
will be quite a while before I TRUST SSL. Way too easy to break.
On the plus side, these are both .OVL related, so hope exists.

As for your current problem, I'd raise heck. Why can't you
apply by other means? Is it a requirement of the college that
you purchase a computer? Most of these decisions are made by
committee, and a few letters to the editor of your campus paper,
a polite but forceful letter to the president/dean/whatever of
your college, etc. will most likely be followed by a review of
their policy. I always fire off an angry email every time I
encounter a site that is not HTML 3 (read CAB) compliant. With
all the cell phones and pagers that can connect to the internet
now, it really is silly for anyone to not provide a text-based
site.

>* What kind of HDD's do they use?

SCSI 50 pin narrow (either SCSI 1 or SCSI2). An adapter is
required which is around $90, if I recall.
>
>* Can I network them?
Yes, using either the MIDI ports or as part of a TCP/IP stack.
It takes a bit of effort, though.

>* Even better, can I network them to the 10baseT network I have
>already?

Yes, but the hardware is quite rare. It is theoretically
possible, however.

>* What use is an ST without a HDD or an FDD?

A computer needs programs. Without a floppy or HD, how are you
going to run anything? Even if you intend to use a network, you
need the networking software. I suppose you could create your
own cartridge and put the software on that, but that would
entail a bit of effort.

>* What's the M in STFM stand for? (iirc F is for FDD)

Modulator. A STFM has a video out port for connecting to T.V.s.

>* Can I rig them up to better monitors (the atari ones seem to
>be 1224's and a 124) [error corrected]

Yes. Any VGA monitor will work with an adapter cable, though
only in ST High (640x400x2). A video card (expensive) is needed
for other resolutions.

>* Would it be easy to get m68k linux onto them?

M68K Linux requires memory protection. 68020 and up required.
One could create a 68000 version of Linux (someone probably
already has), but it would have compatibility problems, I'd
suspect.

>* How easy (and expensive) is it to get them on the net?

If monochrome is satisfactory to you, you just need a couple
freely available programs and a modem. More memory and a hard
drive certainly make the task easier, however.

Try the original Atari xcontrol, at least here it is the most stable
and works with the nvdi cpx's.

Hmm, this is a bit like asking "What car should I buy?". My
Yamaha PSR300 (nearly 10 years old) has touch sensitive, full
size keys. These were my only two requirements then as well as
now (besides MIDI, of course). However, I'm a lousy pianist,
and I only use my keyboard for assistance with my vocal
rehearsals. Perhaps you should tell us what you intend to do
with the keyboard once you have it.

From the ICD adapter, run an internal 50 ribbon SCSI 1 cable to
the HD and back out. This cable should be easy to obtain at a
electronics supply shop and basically looks like the cable you
have, only with a third connector midway. Keep your cabling as
short as possible. Then an internal to centronics 50 (external)
adapter attaches to the case (your knockout, er, knocks out). A
SCSI 50/50 external cable then runs to your "other" drive. If
you cannot find an electronics store, a place that deals with
SCSI (like older Macs) should be able to help.

I don't know if I'd modify things to use your other space in the
Toadfile case. Your power supply might not be able to handle
it, particularly due to its age. As a final note, only
terminate the first and final drive on a SCSI chain (though
there are exceptions). I've done quite a bit of SCSI work on
both Ataris and Macs in the last couple years, so post if you
have problems.

2310. Photo printing in Pagestream

Newsgroup: comp.sys.atari.st
Date: 2000-02-13 00:00:00 UTC
From: atarigalen
Message-ID: <1ab5e9dc.d5f498b3@usw-ex0108-063.remarq.com>
Source record: 65622

I've been playing around a bit with some .JPG photos and my current software. Atariworks doesn't appear to print in color, even when the files are .IMG (which it demands). Pagestream does print in color, but the results are pretty bad, leading me to suspect that PGS was intended to print color line art only. Imagecopy prints great, but one can't include a lot of text.

Can one alter Pagestream's settings so "family letters" with a few photos and a couple pages of text can be created? I'm sending the photos on a separate sheet this time, and I know I could do it with multiple printing passes, but I wonder if I'm missing something.

Dear Edward, I have a similar set-up as you, except I have a TT.
I also use a nova graphics card and Photoline etc.
I had a similar problem with the NVDI Cpx, and I realized that it was due to a problem in the installation of NVDI. When you click on the install program
for NVDI, it gives you several options for graphic cards etc.
For some reason, when I installed NVDI with the "Nova Graphics Card"
button, the printer CPX would not work. I backed up everything and re-installed
NVDI but this time I just clicked the "Atari Graphics" button, just as if
I did not have a Graphics card. This seemed to work, and now I can adjust
the printer settings from the cpx.
I hope this is useful.

>anything else) and where can I get them (and how much will it cost)?

As standard they have an ACSI interface, which is not exactly an
industry standard. Adapters to use SCSI or IDE drives are avaliable.

>* Can I network them?

Yes, but I don't know much about networking... ;-)

>* Even better, can I network them to the 10baseT network I have
>already?

Er... dunno.

>* What use is an ST without a HDD or an FDD?

I wouldn't imagine very much use at all... ;-) Even as part of a
network you'll need to load the networking software.

>* What's the M in STFM stand for? (iirc F is for FDD)

TV Modulator - so you can plug in a TV and use it as a monitor.

>* Can I rig them up to better monitors (the atari ones seem to be 2x
>1224's and a 224 (i'm not sure on the last one))

SC1224 monitors are colour RGB monitors that enable you to use ST
Medium (640x200x4) and ST Low (320x200x16) resolutions. If you intend
doing much serious work a mono monitor might be a good choice. You
can buy adapters to use a VGA monitor as a mono monitor.

>* Would it be easy to get m68k linux onto them?

No, as a rule Linux needs a MMU to run, and the 68000 doesn't have
one. There is a project to get Linux up and running on a 68000, but
AFAIK it doesn't work yet and isn't really a serious proposition. You
can run MiNT though, which will give you a lot of UNIX functionality.

>* How easy (and expensive) is it to get them on the net?

You obviously need a modem and modem cable, but there is plenty of
net software avaliable for free.

>Sorry if these questions are covered in the FAQ, I couldn't find
>one...

I'm sure Mr. Bales will have something to say about that ;-)

Cheers,

Ashley

I do seems to recall, that CP/M was on some of the very first PD disk I got for

the ST back in 1986. I never try it out, because I didn`t like the way it
worked.
My very first computer experience was with a Concurrent CP/M machine.
AMSTRAD made at machine complete with monitor and printer, that use CP/M as
well.

cheers

>whole thing from the ST... oh well, use what you have.

If I'm following correctly you need a midi thru unit like for instance
the Phil Rees V10 which a simple non programmable unit that is
relatively cheap, although there are many about.

If you use your ST with say Notator or Cubase you could try this setup:

```
midi (out) ---------> (in) Phil Rees V10 midi thru unit
| |
| (out)
ATARI ST |
Running Notator | * All Instruments midi in *
or Cubase .----- 1. Akai AX-80 (Master Keyboard)
| | 2. Korg Poly 800
| AX80 midi out | 3. Roland TR-707
midi (in) <-----------------' 4. etc
5. etc
```

This way the master (AX80) would input the data into the sequencer(Atari)
and the program would then transmit the data to the relative instruments
simultaneously via the midi thru unit. If you ever add to your system you
can also just incorperate the instrument to the setup easily.

Regards
Sean

It isn't just a marketing illusion. It's faster I can tell you that. See
my previous posting.
There are also some bugs fixed which makes Cab more stable then it already
was.
Of all the Atari browsers available Cab is still the best. Rock solid with
every OS.

One of the updates was fairly necessary to keep it a useable
program. Before this last version, CAB had problems with defining default
paths for graphics etc. on a site. This was a sometimes cause of
consternation with older versions of CAB. Is that alone worth the upgrade
cost. I don't know. there were others as well. But there were indeed
fixes in places that the average user would would encounter and be happy
about. It really is much more stable on my system.

There is a program called force media change, that forces the floppy to read
the disk directory before it writes to it. I had a similiar problem many
years back, and fmc fixed the problem.

From what I understand , there is a little switch inside the drive which
detects if a floppy has been removed, after years of use, this switch can
get dirty and not function properly.

In 14 years of using st's and downloading files from everywhere imaginable,
I have never seen an st virus. I have heard about the link and ghost virii,
but have never seen them.

Tony,
I see what you mean now! I used the Nexus (3x8 MIDI Switcher) to keep all
lines short. One input (of three) to 8 outs makes a nice thru (actually
direct) system also.

>|
>|HSMODEM doesn't increase the serial port above 19200.

>Funny, I thought the opposite. Certainly the documentation says:

Yes, it is true what you have below. If I am incorrect then I am corrected. However, I don't believe the Modem Port on the ST can take advantage of the higher Speeds without a Hardware Modification as I stated previously in the thread.

What is incorrect about my statement above is that I have written serial, when I should specify Modem Port, and since I believe we were speaking of an ST with a 19200 baud limit on its modem port, and I did mention that speeds above 19200 cannot be achieved without a hardware mod. I believe all options have been covered. HS MODEM is also required to take advantage of speeds above 19200. HSMODEM is required to get an ST working at 9600 and above. STing will not work period, without HSMODEM.

But if HS MODEM can allow an ST to achieve speeds above 19200 without a Hardware modification, then I stand corrected.

Unfortuneately even the clearly written description below is too technical for me to understand. Does the below state that speeds above 19200 on the modem port of the ST can be achieved solely with HS MODEM. If so, then I could use this on all my STs.

My intention was to install the modification to achieve 38400. But I have put this off in hopes of getting a working Ethernet adapter for the ST. If I don't need this circiut, then that would be great.

Later Brian.

Yes, Signature files should only be a handful of lines.
I don't recall offhand what the limit is, but I believe it is around 5
lines, but don't quote me on that.
It does appear NEWsie is working properly in this instance.

Thanks a million!!! ;-)

> Whilst we're on this subject, (and as you're the Support Site for mICQ)
> you know that you can run mICQ from the login.bat, if you use Spawner?
I think I mention that on the site somewhere?! ;-) Yes, spawner is VERY useful.
I use it to run aMail from LOGIN.BAT as well. aMail accepts command line
parameters, so I have multiple email accounts, LOGIN.BAT starts aMail
sequentially with a separate config file, and sends the command to send/receive
mail. So now, if I only want to check/send email, all I have to do is click
[connect] wait a few moments and click [disconnect]. Where there's a will
there's a way!!! ;-)

Cheers,

Jerry

>atari/utilities/mc402.zip (14.089 bytes)
> (Multi Clipboard, up to 9 different clipboards at the same time)

This is an excellent utility, all one has to do is preselect which clipboard
one wishes to use. Once a clipboard has contents, the file(s) extension(s)
is/are shown under its button, and a click on it sends the file to the
application that has been installed to deal with it in the desktop.

There does seem to be a bug in the iconify code however.

It has an additional module for loading PNG format graphic files.

Otherwise it uses the same stack as the previous version, ie IConnect V1.7
or any of the (non MiNT) stacks.

English RSC files and such from the D&D web site should you need them BTW.

Have you noticed that the bubblegem help is a little mixed up in the
"Options/General" dialog (Toolbar section)? This is also a problem with the
official English release of CAB 2.7.

>Can`t follow statements like that, sorry.
What are you going on about?
Sven Kopacz programmed the first commercial stack, and he comments about this, why should he have to write a new stack? IConnect together with StiNG and MinTNet are the only stacks that actually work... Draconis and Wensuite have a long way to go before they can be considered as an alternative....
The poorly translated interview probably confused you, Sven comments on STIK which didn't support PAP, since in 1995 nothing else was available he wrote IConnect, following the UNIX-sockets standard very closely.
If there will be a new browser and if it's from ASH, it will run under the IConnect stack...

>Specialy i mean parts how the "authors" talking about sofware what not
>run on his own atari system.. and TCP/IP sockeds..
>(Software what works perfecly! with a lot other machines)
The only options one had in those days were MinTNet and STIK, if STIK is so good why doesn't anyone use it anymore? Do you use STIK?
I remember when I went on the net my IP didn't support SLIP, boy, was I glad that IConnect was available. And no, I didn't know anything about MinTNet, I found out it existed once I was on internet. (like most people I think)

>(I hope by god he found out, in the first week, that this machine needs
>-ONE- TCP/IP socked for -ALL- relevant internet programs and that this
>machine runs a lot other software as "outlook" or "bad bad munster"
>Netscape too..
I'm sure he did...
He's one of those guys that uses a Mac to emulate an Atari, AFAIK he doesn't run Mac software... in 1995, when one wanted speed and raw power the only option was MagicMac.

>Correct me if i missunderstud some parts in that "nice" interview..
>(Maybee must be a part of the translation too) :->
>
>Further than, that interview fills the magazine, not more.
>Remember me of better interviews.
You didn't misunderstood the interview, Thomas Raukamp did...;-)

I agree that the interview fills the magazine, but I can't remember reading any better ones in STC.... not in the new STC that is...
STC used to stand for quality, when Atari Inside took over, the quality has been thrown out the window.... let's hope Thomas Raukamp makes a better job of it.

Cheers from Belgium
Dennis

<bishop@miskatonic.de> writes
>Sometimes I had used HD disks , but also DDs. Could the floppy be
>damaged by use of HD-Disks ??

No they shouldn't.

But you have jogged my memory on something I've come across in the
depths of time!

Disks, just like video tape, if not stored correctly can grow a fungus
on the media. This can dirty the heads of the drive and give bad and
unreliable results.

I say this because I bought 20 DD disks and had a similar problem. You
can check the disks, by looking at the media itself.

I have also come across a case where a drive refused to work (track 0
error), that was due to dust blocking the optical sensor! This one had
me for ages, I can tell you:)

Viru's, or Virii or something like that, can corrupt disks AND stop
programs working properly. So if a program that has always worked, and
is write protected, may be upset by a virus; especially on STE's.

If you'd like to send me a specimen disk I can look into it for you.

2348. SV: Difference between TT, Falcon & ST ?

Newsgroup: comp.sys.atari.st
Date: 2000-02-14 00:00:00 UTC
From: Peter Persson <pep@REMOVEmbox306.swipnet.se>
Message-ID: <_aYp4.185$7f7.576@nntpserver.swip.net>
Source record: 65565

Hi!

ST, 8mhz 68000, 512 colors, only blip blop sounds, tos 1.0 - 2.x

MegaST, like ST but blitter, megabus, separate keyboard, tos1.4x (?)- 2.x

STE, same as ST but 4096 colors, sampled stereosound, blitter, hardware scroll and enhanced joystickports, tos 1.6x - 2.x

MegaSTE 16mhz 68000+cache(!), VME bus, more / faster serialports, optional internal SCSI interface, otherwise same as STE, Tos 2.x (?)

TT, 68030, 32Mhz, fastram (32 bit wide), SCSI, no blitter, some new better videomodes otherwise as MegaSTE, Tos 3.x

Falcon, 68030, 16Mhz, no fastram, blitter, video improved a lot (hicolor + hi res), SCSI, IDE, special internal expansionbus, sound improved a lot (8 track 16 bit), special 56001 DSP at 32mhz with 96kb ram, audio in, Tos 4.x. Same box as ST (to bad)

I've probably missed a lot.

/Peter

2351. FS: Atari books and magazines - bundle for $20

Newsgroup: comp.sys.atari.st
Date: 2000-02-14 00:00:00 UTC
From: bilstein@alumni.utexas.net
Message-ID: <38a87296.14382990@news-server>
Source record: 65568
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I have the following books and magazines for sale as a bundle. You can see pictures here:

http://www.geocities.com/TimesSquare/Arena/3336/ataribooks1.jpg
http://www.geocities.com/TimesSquare/Arena/3336/ataribooks2jpg

Take everything for $20 plus shipping (will ship book rate if you want). US shipping addresses only please.

All are in pretty good condition, nothing has any seriously tears or blemishes, just some average light wear. I don't believe there are any missing pages, although I didn't comb through each item, so they are being sold as-is. Here are the titles:

BOOKS:

- Your Atari Computer: A Guide to Atari 400/800 Computers, by Lon Poole with Martin McNiff & Steven Cook, 458 pgs
- The Atari Assembler, by Don Inman and Kurt Inman, 270 pgs
- Hands-On BASIC for the Atari 400/800/1200XL, by Herbert Peckham, 304 pgs
- Atari BASIC, by Bob Albrecht, LeRoy Finkel, & Jerald R. Brown, 332 pgs
- Stimulating Simulations, by C.W. Engel, 100 pgs (12 BASIC programs, not specifically Atari)

MAGAZINES AND BROCHURES:

- Atari Explorer: 10 issues: Winter '86, Summer '87, Spring '87, November/December '87, March/April '88, May/June '88, July/August '88, March/April '89, September/October '89, January/February 91.
- The Atari Connection: 4 issues: Welcome Edition, Vol. 1 No. 2, 3, 4.
- An Atari 8-bit Extra from Analog Computing, Summer 1987. Slick cover 130 pgs.
- Computer Entertainment, August 1985. Lots of Atari gaming info.
- Compute! Magazine, Vol. 8, No.2 & Vol. 9, No. 9. '86 and '87, both feature articles on Atari.
- Personal Computing Magazine: 7 issues. Dec '85, May '86-August '86. These are mostly IBM oriented, but I thought I'd throw them in here.
- Atari Personal Computer Product Catalog, 1981, 29 pgs
- Atari Program Exchange, Software Catalog Fall Edition - 1981, 40 pgs

Finally, there is a packet of brochures from various companies offering Atari products. There is an accompanying form letter from Sally Bowman of Time Warner/Atari stating that they have sent these brochures to Atari 400/800 owners as a service to them. It's just a

form letter, but it's still pretty cool, and has the embossed Atari letterhead on it. The brochures are from the following companies: The Source, Creative Computing, Analog Magazine, Quality Hardware, Compumax, Compute!, Custom Electronics Inc, Dorsett Educational Systems Inc, Houston Instrument, Innovision, Kurta Corporation, Macrotronics, The Casemaker, Personal Software Inc, Peripherals Plus, and United Software of America.

Source record: 65569

After reading the previous comment about the ZIP drives, I asked the guy at the computer store about the Orb. He said he hooked one up to his computer and it was *really* fast. Uwe, will HD Driver handle this product? What about the 2.2 GB cartridges? Will I have to partition them, or will HDD let me use the whole thing?

Thanks,

Steve

Hmm, sorry for the four postings in the tech rubric, I had some trouble
with sending to the ng and made this mistake, sorry ...

But to my floppy : It is not only that i have strange files and read
errors. I can't format disks anymore !!! This is really strange (I
think the floppyhead must be reconfigured ??) When I try to format an
error occurs due to device A: isn't reachable or something like that ...

Hi!

In article <0140a50e.aeb5ffc8@usw-ex0108-063.remarq.com>,
atarigalen <kNOk@SPAM@uia.net.invalid> writes:
> will be quite a while before I TRUST SSL. Way too easy to break.

Sorry? So you've found ways to break 128-bit private keys? Or ways to
break key exchange protocols based on RSA/DH with signed certificates?

Or are you just referring to the limitations found in current export
browsers, that restrict the random part of the secret keys to 40 bit?

SSL is - when using non-crippled international implementations - very
secure, and to my knowledge, far from being (easily) broken. It's just
that a secure communcations channel alone does not mean that everything
else is secure, too.

Ciao

Thomas

Source record: 65572

> If Fast Club would have used a decent blank CD instead of some cheapish
> crappy shitty CD, just to make some extra cents profit, Brian wouldn't
> have posted here needing some advice/help in the first place.

All of our CDs are duplicated onto Grade A disks manufactured by Lead Data - the best quality unbranded media we can get. CDs are verified before being sent out.

We replace any defective media by return.

We also replace damaged media for free or at cost price: including CDs that customers have scratched or turned brown by leaving them on a radiator, monitor, etc.

Where Atari users are using older SCSI single and double speed CD ROM drives, which can be variable at reading CDR media, we will replace with media from other manufacturers until we get one that works in the drive.

In this case the immediate problem wasn't even ours - we didn't sell the CD to this customer!

> I suggest we all send our telephone bill to Fast Club. That'll teach
> them using cheap crap. ;-)

It'd be a lot more profitable if we stopped supplying anything to Atari customers ... thanks for your support and encouragement :((

PRINTER SWITCHBOX Pengo 25-pin for modems or printers $ 10

ROLAND D-50 Synthesizer, great condition classic synth, includes MIDI $511
cables

SPECTRE GCR the premiere Macintosh emulator - complete and upgraded with $ 23
ROMS (disk/docs/cable)

ST/IME internal clock/calendar from Zubair Interfaces Inc, sets your $ 14
clock automatically every time you boot. Incl box, software and hardware.
Suggested retail was $57.95. Brand new. No guarentee on lithium battery
(estimated 10 year lifespan)

SW ADVANCED Art Studio paint program from Rainbird (disk) $ 1

SW AEGIS Animator animation generator and viewer (disk) $ 1

SW ASSEMPRO assembly language compiler (disk/docs) $ 1

SW BALANCE Of Power strategy game; manual needed (disk) $ 1

SW BATMAN game based on 1st movie by Ocean - fun! (disk/docs/box/sticker) $ 3

SW BENTLEY BEAR Magical Math II, educational, published by Atari (disk) $ 1

SW CRACK'ED game published by Atari (disk) $ 1

SW CYBER Studio Set - hundreds of dollars of great CAD/paint/render $ 17
software! cyber paint v2.1, cyber mate v1.1, stereo cad-3d v2.02, cad-3d,
plotter & drivers, human design disk, cartoon design disk, cyber control
(disk)

SW DAC Easy Accounting software 2disk (disk) $ 1

SW DEGAS Elite - brand new! original disk envelope is unopened! $ 6
(disk/docs)

SW DIAMOND BACK 2 great backup program to most any media (disk) $ 1

SW DR.T's Roland D-50 Editor/Librarian, synth also available see below $ 23
(disk/docs)

SW DUNGEON MASTER includes Secrets of Dungeon Mastery book, considered by some to be the best ST RPG game ever! (disk/docs) $ 1

SW EKG Teaching By mad scientist software educational, EKG parts/ rhythms and pathology recognition (disk) $ 1

SW EZCALC good spreadsheet (disk/docs) $ 1

SW FLEETSTREET PUBLISHER v1.0 3 disk set, top notch DTP program (disk) $ 1

SW FSM GDOS 5 disks (disk) $ 2

SW GDOS original Atari version 2 disks (disk) $ 2

SW GRAMSLAM grammar and style checker, checks for 1200 errors, can run as an ACC or PRG, works with all word processors (disk/docs) $ 1

SW IMAGE CAT complete graphics cataloging system for all Atari ST computers (disk/docs) $ 1

SW INTERLINK ST packaging/box only (no disk, no docs), beautfiul black plastic videotape style box with the company logo all over; slides into a white Interlink box $ 1

SW LEISURE SUIT LARRY 2(?) Looking for Love, classic sleazy fun w/pixelated nudity by Sierra (disk/docs/box) $ 2

SW LEMMINGS Oh No! More Lemmings - great puzzle game by Psygnosis (disk) $ 1

SW LIVRE Du Graphisme (disk) $ 1

SW M1 TANK PLATOON still the best tank sim out there, all original manuals (heavy Microprose kind:) and box included, includes PC/DOS version too (will run on 286&up!) (1 DOS floppy is corrupted, but I'll include a working backup) (disk/docs) $ 4

SW MACRO Mouse by Antic, record mouse actions (disk) $ 1

SW MEGATRAVELLER missing disk A it seems, disk B only (disk/docs) $ 1

SW MIGRAPH drawing utilities set includes TouchUp, MergeIt and Scan&Save, manual for Mergeit only (disk) $ 3

SW NEODESK2 v2.0 the famous desktop replacement, might be upgradable (disk) $ 1

SW NIGHTSHIFT 2 disks game by lucasfilm, so you know it's good! may need a manual for copy protection (disk) $ 1

SW OMEGA strategy game by Origi (disk) $ 1

SW OSS Personal Pascal v1.02 (disk/docs) $ 1

SW OSS Personal Pascal v2 (disk/docs) $ 5

SW PIPE DREAM game by lucasfilm, so you know it's good! may need a manual for copy protection (disk) $ 1

SW QUICKST v3 screen accelerator for ST/STe/TT (disk/docs) $ 3

SW RED STORM RISING submarine simulation 2disks one of the best realtime $ 1
strategy sim games for the Atari! amazing sim of realtime submarine combat
(disk)

SW SIMCITY the city simulator, great game! (disk) $ 1

SW SIMCITY very addictive simulation game, may need manual for copy $ 1
protection (disk)

SW SPEEDO starter kit, incl SpeedoGDOS and 20 bitstream Speedo outline $ 5
fonts & 5 disks of fonts from Toad computers; 9 disks in all! (disk/docs)

SW STALKER 2 older version probably upgradable (disk/docs) $ 3

SW STALKER3 v3 best telecomm modem software (disk/docs/box) $ 15

SW STENO 1 older version probably upgradable (disk/docs) $ 3

SW STENO2 v2 best text editor works great with STalker (disk/docs) $ 6

SW SWIFTCALC ST by Timeworks great spreadsheet with graphing 2disks $ 3
(disk)

SW TEST DRIVE 2 the duel, European challenge addon, the supercars addon, $ 1
great car racing game with 2 bonus packs of cars! 4 disks (disk)

SW TEST DRIVE by accolade (disk/docs) $ 2

Source record: 65575

A friend of mine is attempting to access a local text based Community Network. He has what a kind person from an Atari newsgroup suggests must be a model 520 ST with 512K of ram and no hard drive but a 3.5 floppy drive. Does anybody know of a communication program that will work with this limited ram? If so, is it a possibility that it could be sent to me as an attachment, or advise as to where I might find it for Download.

The local network requires VT100 for communication if this is important.

Thank you kindly for help in advance,

Leo

That doesn't always work, as some people don't care.

Case in point:

After having successflly tested my bank's web payment system at work, on Netscape, I decide to try it at home. CAB succesfully opens a secure connection and a cookie is received. After the username and single-usage password are inputed, I get an error message from the server that cookie support is required.

I contacted my bank's customer support and got several clueless replies, until I spotted a tiny bit on the main page that says they only recognize Netscape, Explorer and .... AmigaWEB.

Explaining calmly what they should do, to test browsers for SSL and cookies, instead of dumbly parsing the browser/agent string, I get more bullshit about their server being based on "standards" which my browser doesn't support, so they cannot help.

Incidentally, another bank allows CAB with the SSL-enabled OVL just fine and several Atari users in this country like it. Why? They don't parse HTML headers, they just send cookies and open an SSL connection; no second-guessing what the customer uses. Now, _that_ is a standard. Too bad _my_ bank is so clueless...

Well, we found out that we can do it the old-fashioned way, but we have to go in to the financial aid office - they're no longer mailing the forms to us, only the URL for the web-based form. So we got that figured out. As far as the site goes, it uses Javascript, therefore assuming everyone uses PC's or Mac's running the latest versions of Netscape/MIE. The initial form page can be loaded into CAB, but the buttons going on to the next step won't work. Why they couldn't just use standard HTML to do the exact same thing, who knows! Sounds like the Webmaster is the type of person who uses the latest whiz-bang technology just to screw in a lightbulb. The US government at its finest! Anyway, my problem is solved by means of good old-fashioned paperwork!

I'm not sure about any of this as I don't have a color printer but check out the options 'Global' choose 'Edit Color Palette' for settings and then check out under the 'Object' menu and choose 'Edit Coordinates' the last two items 'Screen Angle' and 'Screen Frequency'. A good starting point for these setting (Angle & Frequency are angle = 45 and Frequency = 60). Play around with 'em. Hope this helps.

CP/M is an operating system which was used on various 8-bit computers
(Amstrad CPC, MSX, C128). TOS is based more or less on parts of CP/M
68K. There are (were) thousands of applications for CP/M - most of them
were converted later for MS-DOS.

I remember that Wordstar was for a while sold together with the CP/M
emulator in Germany as "WordStar for Atari ST".

Greetings,
Matt.

> are chucking out... because i've not used atari's for years i've got a
> bunch of questions:

First of all, take a quick look at the Quick FAQ. It should answer most of your questions. That's what it was designed for anyway.

> * What kind of HDD's do they use (I've never seen the connectors on
> anything else) and where can I get them (and how much will it cost)?

- Old Atari Hard Drives (60megs max, if you're lucky enough to find a working one).
- SCSI drives with a SCSI host adapter.
- IDE drives with an internal controller board.

> * Can I network them?

Yes, through the serial port with STinG. Ethernet is possible, at a stretch, but this means a lot of fiddling with home made adapter boards and stuff like that.

> * Even better, can I network them to the 10baseT network I have
> already?

See above.

> * What use is an ST without a HDD or an FDD?

Without both, none. How will you load program without at least a floppy drive.

> * What's the M in STFM stand for? (iirc F is for FDD)

F is for Floppy, M is for Modulator. This allows connecting to a standard TV through the antenna connector. If you can, SCART is much better. E is for Enhanced, and includes both, plus lots of other things.

> * Can I rig them up to better monitors (the atari ones seem to be 2x
> 1224's and a 224 (i'm not sure on the last one))

SC monitors are colour, SM are mono. Different resolutions, different uses. You can rig them up to a VGA, but you'll still only get mono hi-res.

>
> * Would it be easy to get m68k linux onto them?

No. It requires at least an 030 and a large hard drive.

> * How easy (and expensive) is it to get them on the net?

The cost of a 14.4K modem. For the software, there are commercial or
freeware options.

> Hmm, those should do for now ;)
>
> Sorry if these questions are covered in the FAQ, I couldn't find
> one...

You didn't look ;) If you type "Atari" and "FAQ" in Yahoo, you should find
the Quick FAQ.

Hi,

Where is the best place to get the most recent GCC for
the Atari? Ive tried a few ftp servers with mixed results.

Cheers

Bob

What type of disks are you using? double density or high density!

If you're using HD (high density) disk in a double density drive, then
that's your problem.

Just one more thing .....sorry to be a picky guy, but the problem with long MIDI chains is NOT signal loss......it's delays, or latency. If you use a MIDI THRU spider like the phil rees box then you don't really have a thru chain anyway...the devices get midi simultaneously in parallel. Try and keep your MIDI cables under 20 ft total (that's between keyboard - st - thrubox - device), and you should be laughing.

That's very odd. I can't test this XBoot patch here, because the patched
result has severe difficulties with my CT2 board, however a similar patch
produced for another project asks for BUGGY.APP rather than BUGGY.PRG.

ASH's Emailer is rather neat in this respect, the paperclip icon shows how many attachments are present (if any), and allows them to be viewed, extracted or saved as is, using the appropriate utilities as installed in the desktop. Handy for the occasional html that's included in a message, one can see it viewed as it was meant to appear via CAB.

Despite being a die-hard Atarian I'm forced to agree with you. Although there is Draconis (which is alleged to handle javascript), as yet there's no SSL-capable overlay for the average user.

Many sites don't even display properly, which leads to a frustrating experience to say the least.

I've purchased a cheapish laptop which now takes care of most of my browsing needs, not only is it more compatible it's also much faster.

>If you contemplate further down the line installing a
>CENTurbo II, make sure the FPU chip is rated 33 MHz

I'm not at all certain that my FPU is being used. GEMView displays the row of dots that it uses to indicate that the FPU's not being used to decode (reference earlier, other threads on this subject), Kandinsky behaves the same way that it does if there's no FPU (despite using the 030 version), and Technobox's Drafter flashes up the "FPU not found" message as it initialises. OTOH Profile reports that the FPU IS present, both cookie and physical presence. So what gives, one wonders?

All Fortress BBS users.

Now theres something ive been wanting to say for some while!. 8~)
To business

Following some TLC this evening the <Fortress> BBS is now up and running
again.

Problems were down to the ICD clock not rolling over correctly at new Year
resulting in Jetmail being a tad confused.

The Clock has been reset and re-boot tested, Jetmail has been upgraded.

Note, this system is Mailer only at the moment.
The sysop is not in residence so dont expect quick answers to any mail.

If there's a problem you can NetMail myself and i'l pass on anything i deem
relevant. 8~)

Would all international NeST nodes please attempt a poll to catch up.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.
* MegaSTE 40Mhz 68030, 68882 FPU, 4+16 Meg RAM, SCSI II, MV-300 *

Which you did offer to do if SFT in NA was unable to accommodate.

>We also replace damaged media for free or at cost price: including CDs
>that customers have scratched or turned brown by leaving them on a
>radiator, monitor, etc.

Hmm, mines not brown, not even from these peanut butter sandwiches.
Not red either from the jam:-). Systems for Tommorrow has offered to
replace the CD. Great place to deal with.

>Where Atari users are using older SCSI single and double speed CD ROM
>drives, which can be variable at reading CDR media, we will replace with
>media from other manufacturers until we get one that works in the drive.

This is apparently true as many people have told me. I believe my CD ROM
drive is a 2 speed, but it turns out that the CD completely locked up my
Friends PC with a 24 speed CD Rom. It could read further into the CD before
becoming confused and lost. At least the Atari Recovered. The PC required a
Reboot. Couldn't even manually eject without a reboot.

So while the PC was lost and confused, and had to be rebooted and then wait
for it to return to action, the little ole ST was still humming along, but
the CD ROM drive doesn't recover without an Eject and reseating of the CD
in the drive.

>In this case the immediate problem wasn't even ours - we didn't sell the
>CD to this customer!

That is correct, and your offer of service to me from across the ocean if
SFT didn't have any other CDs was greatly appreciated, however, it will not
be necessary.

Thank you for the offer, it is good to see this kind of support for a
product.

>It'd be a lot more profitable if we stopped supplying anything to Atari
>customers ... thanks for your support and encouragement :((

How true. Regardless of the encouragement.

No different than some assume older CD Rom Drives for problems others assume it could be a low quality CD Media. If you use good quality and I test on newer CD Rom Drive, then simply one CD has fallen failed. Nothing traumatic, however, it is good to see such direct involvement from a supplier.

As it is, this was my first purchase from SFT. I wouldn't hesitate to purchase from them again in future. In fact I will be, as I intend to order more stuff to be shipped with the replacement CD.

I offer my thanks to..

Systems For Tommorrow
FaST Club

for their direct support of the media.

And to all the readers here, who helped me
diagnose the problem to actually be the
Media. This has saved me a little money as I was just
ready to buy a newer CDROM drive;-).
While the Writeable one is next anyways.

>Regards, Paul Glover

Thanks Paul for the followup.

Brian.

Sybolt asks for specs on the SM125 (I keep writing in English although people actually interested will probably reside in the Netherlands - but the newsgroup is in English).

I am not quite sure about that. It is an SM125 (it says so on the monitor and on the sales slip which I still have), but I have only some documentation on the SM124. I vaguely recall having known the (slight?) difference, but I don't remember...

The following is from that doc: 30 cm diagonal, actual display about 210 * 310 mm, 640 * 400 pixels resolution, freq hor 35.7 kHz, vert 71 kHz.

Frank

I would recommend Flash 1.6 for that purpose. Another possibility is
the program Uniterm. Flash works quite well in a 512K environment, and
I THINK Uniterm will work, but not as well as in a 1Meg system.

Yep...
Now... where to begin....
Have been using Winston before I got these, to prepare for when I found an ST.

Anyways...
I'm a home studio producer & have been using various audio apps for a dog's age. I've always been an 8 bit person (huge collection of 8 bits).

I want to actually use these ST's in the studio to control my synth modules & have had
minor success with basic midi tools... But now I want to run my other apps... Problem is
not only space constraints, but resolution as well.

Any tips n tweaks for the beloved 1040's out there?
I read rumors about using 30 pin simms for memory upgrades etc,
but when I cracked open the ST's, there were no slots, just embedded chips.

Basically what I'm asking, are there any in depth sites out there for ST technical tweaks etc?
vga -> st port lead maps etc?
Any resources regarding the megafile? (i'm getting one this week for $5) :)
Can I use different Hdds in the megafile? This one looked as though it took ide or narrow scsi cabling.
Thanks a million!

It worked with the patch *I* generated with Egale as a test OK. But of course you have to input the correct file names when generating the patch and when running it. The 'bugged/buggy' is only an example in the text - I used xboot.prg for the input when generating the patch and xboot320.prg for the output of running the patch; what names did you use, Derryck?

Didn't CAB development switch to C from v2.0 onwards? I'm going from
memory here.

Thanks for the Info and table for the floppy jumpers, it still hasn't solved my problem which isn't exactly Atari, I have got this upgrade for a keyboard that retrofits a hard drive interface via the floppy, the problem is that it only works with the floppy it was sent with which concerns me in case I need to ever replace it, the floppy is not modified in any way but has a lot of dip switches on the circuit board, I have an almost identical one but with no switches on, I am trying to find out what the sometimes eight pins are for ,one drive I have even has two of the jumpers plugged into a small cable going back to the power connector!!

All the best

It appears that you may have some corruption of your drive which is incorrectly assigning sectors to files to which they don't belong.

I suggest running a utility such as HPOptimizer on the partition to check it over. You can download HPOptimizer from the "Translated apps" page of my web site.

I just read my posts from the 14th, and it certainly does appear to have worked. I wrote the post before this one offline last night, but didn't send it until I logged on tonight, before I read the posts from the 14th. I wrote those posts offline, too, and I looked at them in the "Offline Postbox" before sending them. I didn't think it worked, because the signatures didn't appear when I read from the "Postbox." It seems the signature isn't added until the message is actually sent, something I didn't realize until tonight. I think the turning point was Xing the "Append Signature" box in the "Message Options" dialog. I hadn't done that before, relying on the box in the "Send" dialog alone.

I apologize for the mess of my last few posts, and for the irritation I allowed into them. I'll try to avoid such things in the future. I don't know if I'll keep a signature file or not. Most probably, I'll get tired of it very quickly. Until then, though, I shall be...

Who is interested?

For any reaonable offer, to get in the Hague (the Netherlands):
Atari 1040 STf
SM125 b/w monitor
Harddisk SH 205 (20 MB I think)
disks with various software (GFA Basic, WordPerfect, UniTerm, TeX,
SchoonSchip, games, etc, most with manuals) and Dutch books.
The Atari itself (bought in 1987) functioned well last time I checked, the
harddisk (from 1989) is unreliable.

I have tried a couple of times over the years with no results. What is a good group to post binaries too? I get a lot of request for odds and ends, and I switch ISP's often enought to not make it worth while to setup a Web page to grab the files from. Binaries posted here would be like starting a Mac war:) I should probably read the FAQ (sorry Nick:).

Thanks,
Mike

No, DISKUS will not support this. Special file systems require special
tools to check them. DISKUS can't provide functions for all available
file systems. Note that the main support for these partitions is not
built-in in HDDRIVER but is provided by MagiC and MiNT.

> and it was *really* fast. Uwe, will HD Driver handle this product?

Basically HDDRIVER supports any SCSI/IDE/ATAPI drive. So I don't expect
any problems. For HDDRIVER it's sufficient if the drive supports one of
these standards.

> What
> about the 2.2 GB cartridges? Will I have to partition them, or will HDD let
> me use the whole thing?

This is not a question concerning HDDRIVER but it has to be asked with
respect to TOS and the file systems used. The usual limitiations apply
for any kind of media. Standard FAT partitions are size-limited by TOS,
e. g. 1 GByte on the Falcon, 512 GByte on the TT. If you want a larger
partition you have to create a FAT32 or EXT2FS partition and run MagiC
and/or MiNT. HDDRIVER supports all these alternatives.

Source record: 65590

I recently bought lizard single on Atari ST plus a drivers disk for the yamaha SY/TG serie (.inf and .ins files). I wanted to install the SY/TG77 driver (SY77.inf and SY.ins) but it didn't work with the program install.prg on the master disk (including lizard single). The master disk seems to have been already configured with a driver (TG33).

I also didn't find the .cod files mentionned in the installation manual for the drivers installation on the drivers disk. Is there a solution or have I lost 60$?...

Thanks.

As far as i know ATR are independant. They were founded by a guy called
Alec Empire, who owns the record label DHR Recordings. They have a
website at www.digitalhardcore.com .. AFAIK, Atari Teenage Riot are
called such because they use an Atari ST for all their midi stuff..
kinda like The Prodigy being named after Liam Howlett's first keyboard,
a MOOG Prodigy.

did you listen to the album? they do some good stuf...

Well Alex decided a long time ago that it would be useful to have
me on his beta list.

As to encrytion. My understanding from the articles I've read and
been able to find so far... (I haven't been able to find the oficial
governemnt document)

Major companies will be allowed to ship 128 bit encryption after
an approval process. Everyone else will be limited to a lower
level. Can't hurt the donors during an election year :P

If anyone has a link to the official new US standards please let
me know. I've been following it through a few linux sites and so far have
seen nothing but news coverage and peoples interpretations. No real
definative, this is the US government and this is what we will allow.

Hi!

In article <38AA5B44.481BBBC2@siemens.at>,
Janka Gerhard <gerhard.janka@siemens.at> writes:
> statement should say <2GB on the Falcon, or am I sitting on some sort of
> time bomb because of effects at partition sizes >1GB that are not
> immediately to be seen ?

The latter. According to Michael Schwingen, who has the TOS source code,
at least Fseek() (the function to "jump" to a certain position in a
file) doesn't work correctly with such partitions. Thus, if you don't
want to risk corrupted data, better stay inside the official parition
size limits, which is 1 Gig for TOS 4.0x.

Ciao

Thomas

>fault -I probably try the patch when Okami was in memory- but nevertheless
>it shouldn't do such things.

There seem to be different versions of Xboot 3.10 around... :-/
The patch will work with the version that is 91700 bytes long. It will not work
on Xboot 3.10 versions that are 91698 or 91712 bytes long.

Whatever happened to your okami .def file, wasn't the fault of the patch. All it
does it search for an Xboot that is 91700 bytes long and patch it. If it doesn't
find it, then there's no further action on behalf of the patch...

Cheers from Belgium
Dennis

I have the same experience as Pascal with CAB 2.8...
No matter what size of Jpg's I load they are always loaded and displayed
significantly *slower* then with the previous version. With certain pages the
loading time is nearly double !! so I'm using the old JPG module now with CAB
2.8, perhaps the new JPG module is optimised for an 68060 ?

Cheers from Belgium

> e. g. 1 GByte on the Falcon, ...

I'm somewhat confused by that. Recently I got a 19GB IDE HD for my
Falcon
and after updating to the latest version of HDDRIVER I can use it all.
By trial and error I found out that when I make 2048MB Partitions, TOS
cannot access the partition but when I make it <2GB (2047.9MB) then
everything seems to work okay. Is that like it seem, i.e. the above
statement should say <2GB on the Falcon, or am I sitting on some sort of
time bomb because of effects at partition sizes >1GB that are not
immediately to be seen ?
BTW, IIRC I had to make the boot partition smaller than the others
because
it won't boot otherwise. I wonder what's the reason there.

Gerhard

The STFM has soldered-in chips. The STE uses SIMM's.

To use an ordinary VGA monitor on an ST? Yes, easy.

> Any resources regarding the megafile?

Make sure you get a MEGAFILE 30, 60 or 44.

> Can I use different Hdds in the megafile?

The 3 above uses SCSI drives internally.

```
Resolution is linked to the monitor you are using. For serious stuff, you
NEED a hi-res monochrome monitor like an SM124, SM144, etc...

> Any tips n tweaks for the beloved 1040's out there?

Plenty, start with the Quick FAQ.

> I read rumors about using 30 pin simms for memory upgrades etc,
> but when I cracked open the ST's, there were no slots, just embedded
chips.

The SIMM upgrade is available only on STEs, not ST/STF/STFMs.

> Basically what I'm asking, are there any in depth sites out there for ST

In the Quick FAQ.

> Any resources regarding the megafile? (i'm getting one this week for $5)
:)

You'd be better off with a modern SCSI or IDE.

> Can I use different Hdds in the megafile? This one looked as though it
> took ide or narrow scsi cabling.

Nope, they use ancient MFM drives, max 60 Mb. See the Quick FAQ.

Set the ID to 1. You turn on the drive first. When you switch on the ST it
should boot load the SCSI drive. If it doesn't, then you need AHDI to make
the drive bootable. Get it from http://bales.online/atari/files

2430. Error message from CAB_OVL and other things.

Newsgroup: comp.sys.atari.st
Date: 2000-02-16 00:00:00 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <38AAA69C.8D64FFFE@patent.gov.uk>
Source record: 65525

a. Using the latest CAB_OVL from Oliver Booklage I'm getting an error message about an illegal length package being received. This is on URLs that are OK on earlier OVLs. Also I've been trying to get Julian Reschke's page, CAB 2.7 either locks up or reports the page doesn't exist. It's there of course with Netscape.

b. Very interesting news about the memory bug in Pure Pascal, the language of CAB, as I sometimes get 'Fatal memory error' type messages in CAB. At the time of enquiring here, I was told it was due to my use of Magic and/or Outside. Anyway will download the patch and see.

c. Newsie: I use Zetnet. When I connect to the News section, I find that the news, eg from this group is way out of date, eg last night it was 2 Feb. even after 'connecting to ISP' or whatever. Is this a Zetnet thing or a Newsie thing, or what am I doing wrong. Must admit I always wait until I'm at work, (now only mons to weds, semi retired) to send/receive mail or news, as Newsie is just too primative.

Bob king.

Nope, the Megafile 60 uses RLL drives. All 20 Mb model were MFM. The megafile manual states the Megafile 30 also uses a RLL-drive.
I thought the Megafile 44 had a SCSI drive, but I could be wrong.

Yes, the 125 has a tilt and swivel based.

It also has an off/on switch with separate volume control.

The controls are also on the front. You don't have all the controls that
the 124 has; I think the contrast is missing!

After using CP/M for years, I would say that TOS has more in common with
CP/M than any other OS. Amiga OS was built on a UNIX-like clone and Atari
TOS was written a CP/M-like evolution from the guys who created CP/M.

Being a big CP/M fan for years then a UNIX nut, this is why I enjoy seeing
Atari TOS as almost the natural evolution of CP/M and AmigaOS as a kissing
cousin of UNIX.

This is no longer the case. Kits exist to run SCSI or IDE. Of
the two, the SCSI kit is cheaper but the SCSI drive is more
expensive, so it's largely a push in terms of cost. If I were
starting over, I'd buy SCSI anyways, just because it doesn't tax
the 68000 as much.

Try posting a copy of this message to your bank (reworded, of
course). The people you are talking to sound as though they are
not the people to whom you wish to speak. If you can catch a
higher level person's attention, he will want to know why HE
can't get your business when other bank's can.

By the way, I thought that CAB could send a "Netscape" string.
More than once I've had servers think that.

ISTR a problem with some floppy drives not working on some Atari's due to a pull up resistor on a select pin of some sort being of an incorect value for that environment. Buffering of the signals or experimenting with the resistor value cured this prob. You may have a similar scenario..

2442. Wensuite PPP

Newsgroup: comp.sys.atari.st
Date: 2000-02-16 00:00:00 UTC
From: Freek Munniksma <munkie@xs4all.nl>
Message-ID: <88euj0fdg1@news1.xs4all.nl>
Source record: 65537

Hello everyone,

i tried to log in to my ISP(XS4all in NL) with wensuite 3.20 (and up). The
PPP link can't seem to get an IP address from my ISP. My french isn't good
enough to comprehend what goes wrong. It say something like: "Connexion
reussi, adresse IP 0,0,0,0". In the PPP link setup you have to fill in
0,0,0,0 if you have a dynamic IP address(the ISP gives you an IP address).
It also strikes me that you can't seem to be able to fill in the name of the
proxyserver of the ISP in the PPP link setup.
Any Wensuite experts out there? Shame that i can't get connected with this
promising browser.

Greetings, munkie.

Just as I'm finding my gaming moving slowly to the Playstation,
I think my browsing will eventually go set-top as well, perhaps
with the Motorola Blackbird (w/Nuon).

It'll be a long time before I replace my Falcon.

No, I was referring to 40-bit, although most of my concern is
with the data's arrival.

The way I see it, the receiving computer has to be outside a
company's firewall for me to access it. So my data (which gets
decrypted before storing, as likely as not) is sitting for some
time on a computer that is open to attack. Now I realize that
all communications systems have flaws. Someone could tap my
phone line and they could steal the mail when the postman isn't
watching. However, I perceive the Internet as being
significantly more risky than the telephone right now.

Yup, it worked fine, Steve.

Now if only the world's most popular mailer (Outlook Express) created a
proper delimiter. To be fair, OE 5 for Mac does this correctly, although
v4.5 has a bug where the trailing space is inexplicably removed during
posting (perhaps the same bug that affects OE 5 for Windows).

Mine is also 58098 bytes dated in the "About Xboot" dialog to Nov 29
1993.

The XBOOT.PRG file on my _very_ original distribution disk is dated
29/11-93 at 16:00:00 hours.

But, the folder XBOOT was created 12/1-94 at 16:13:36. Interesting!

From: jfhaslam@zetnet.co.uk
Message-ID: <38ab38b3$0$16857@news.zetnet.co.uk>
Source record: 65543

Hi all!

I'm having a problem with v1.22 of Sting, in that the DNS cache load keeps failing (the message keeps coming up on loading in the Auto folder).

With previous versions all I had to do to get rid of this message was to delete the CACHE.DNS file, but with this version the message still happens.

I'm using a standard Falcon, 14Mb of ST Ram, MagiC v6.01, NVDI v5.02.

Anyone?

Cheers!

James

I have in my possession the Mitchron Vt220 emulator (vt100 etc)
Also I have used flash to log onto an ISP some years ago. It runs
VT-50 and I think VT-100. If you are interested I can let you have
a copy.

I havent tried to use it recently.

>patch and when running it. The 'bugged/buggy' is only an example in the

Dennis has pointed out that there seems to be several different variants of
Xboot with varying filelengths: That means that the patch will only work for
some people, but not for others.

Some variants I know of:

The packed original
Unpacked version of the above
Unpacked version patched for the Afterburner

So you can see the potential minefield...

after further messing about with jumpers I have got the thingy to work with
a selection of old floppy drives, the only thing I can't get it to go with
is a brand new one that seem jumperless, there has been mention of
disconnecting a small resistor somewhere on the board but to be honest the
components look to small for a human to solder the only other thing I can
see are several solder pads that maybe could be joined to act as jumpers but
just which ones , no help from the Panasonic site like most it's all sell
and no info

Check out the Quick FAQ. Either IDE or SCSI can be used, but both require an
adapter of some sort.

It only seems this way. There is at least one bug in GEMDOS that does
not allow to safely use partitions > 1 GB. That's why HDDRUTIL
recommends not to create partitions of this size.

Hi, I have an Atari 520 ST that I'd like to give away to a good a home. It's the model with internal floppy and RF modulator. This system also includes a SC1224 color monitor, atari mouse, a 3rd party trackball, and some software.

I'd prefer that someone come and pick up the unit but I willing to ship as well. I'm located in Prince Georges County, MD (USA). Please email if you're interested.

Thanks,
Liam Busey

...because it will be overclocked to 50MHz. But how safe is it to do so?
I have been warned that MC6888X FPU chips tend to give floating-point
errors when overclocked.

I do not have a Falcon, but I have a MegaST with MC68881 FPU (12MHz)
which, on the hardware side, would be easy to drive with 16MHz- but
the docs for 12MHz FPU say that 12.5MHz is the maximum operating frequency.

James,
Can you connect to your ISP OK? (Browse/E-mail, etc.). If so, personally,
I'd ignore it!!! It's only supposed to show that way once on your first
boot. If there's a problem connecting, try making sure you're using only the
latest Sting/Dialer package (can't mix with older stuff) along with HSMODEM7.

>Oops! ... slower than the old one ... but your test says something
>completely different.

They surely shows something different. I don't know why Dennis, you and
maybe others too have another experience but here on my Hades Cab 2.8 is
definitely much faster then v2.70.

I did another test with the same page as my previous test but this time in
32b color mode.

Cab 2.70: 3 min. 11 sec (256k mode = 3:18)
Cab 2.80: 45 secs (256k mode = 0:47)

As you see the different between 256k and 32b mode isn't that big.
Not surprising as most of the time get lost when Cab loads the picture.
Cab 2.70: about 12 sec for a 68kb progressieve jpg
Cab 2.80: about 3 sec for the same jpg

BTW: With Cab 2.8 I'm using 'jpeg_png.ovl' (165.844 bytes)

Ok! Got the Penguin demo. Is there a way to see the demo page in CAB?
I guess that would defeat the purpose as a demo thus making it too usable
without buying it! (answered my own question!). It seems there's a lot more
to Penguin than Web Wizard but neither has a sample demo page to see what
the program does for a web page! Guess I'll buy both! (answered my own
question again, eh?).

Hi Joe!

Yes I do have it set. My DNS_CACHE is also set to 64. Is that a good
figure? I have plenty of ram (14mb), so I suppose I could increase it.

Cheers!

James

2474. Converting CD audio to MPG/WAV

Newsgroup: comp.sys.atari.st
Date: 2000-02-17 00:00:00 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <38ac529b$0$16849@news.zetnet.co.uk>
Source record: 65420

Hi all!

Does anyone know if this can be done on an Atari? It's not for copying of copyright material, as I'm doing a website for a friend who is a musician, and it would be very useful for him to have a track or tracks converted from his CD to an MPEG, which could be downloaded from his website.

If thats's not possible can it be converted instead to a WAV file (without resampling)?

Cheers!

James

Terry,
I think your missing my point! More power to those who have succeded and
moved on and thanks for those who are die-hard!
I meant "resurrected" regarding creating Atari games (like in the
good 'ol ST days!). A company like Hasbro could agressively market the Atari
name which in turn would attract more "game" programmers (among other
benefits). Hence, the subject of this thread: "Atari Name" on Hasbro owned
games!
P.S. For some reason following up using your last post has'nt worked here!
Tried a few times!
John G.

2484. magic & lattice C

Newsgroup: comp.sys.atari.st
Date: 2000-02-17 00:00:00 UTC
From: Dave Parsons <parsonsd@wam.umd.edu>
Message-ID: <Pine.GSO.4.21.0002171724180.19087-100000@rac3.wam.umd.edu>
Source record: 65430

I'm reposting this from comp.sys.atari.programmer:

I am trying to get magic (v5... I think) to allow me to use LatticeC (v5.6). Now, I can *use* LatticeC, even compile, but if I made any mistakes, causing lattice to tell me I'm getting compilation errors, magic gets really upset and crashes catastrophically ("system halted").

Anybody else have similar problems with crossing magic and lattice? I haven't bothered to try LC.ttp to compile without using the menu-set options (not sure how to do that, anyway), but I do know that it has nothing to do with any accessories I use. Must I go back to swapping between everest and latticeC under TOS, put up with the lattice editor, or is magic6 any nicer?

... every day a new instrument and a new method is invented.
-- Theodoric (1267 AD)
----parsonsd@wam.umd.edu---http://www.wam.umd.edu/~parsonsd-----

PS: is anybody in America sponsoring everest? I never did quite figure out how to not use US (International?) money orders, nor personal checks with InterActive to get it registered.... now I cannot even send money to them!

It's not just OE5: AFAIK all versions of OE are the same, as was its
precursor MSIMN. All my sigs have teh space, but OE loses it when
posting :-(

2490. To write a CD-ROM ?

Newsgroup: comp.sys.atari.st
Date: 2000-02-18 00:00:00 UTC
From: maxilys@normandnet.fr
Message-ID: <981db78390B802A1.46@nest.ftn>
Source record: 65436

Hi everybody,

I just "found" a CD-writer. It works pretty well... But I have to cope with the _infamous_ CD-Recorder.

I patched it to let it use pdomain(1). It works... but only when I choose the source! I wanted to let it record a Minix partition but this _infamous_ CD-Recorder failed on the first folder. (Only 10 chars...) :-\

Error -34 (Path not found.)

Apparently, it uses fsfirst() and fsnext(). And, that, I can't patch it... At least not so easily as I did when I added a pdomain(1) at the very beginning.

So, the question is: What exists on Atari to write CDs which is able to recognise long filenames?

And a second one: Where can I find this? (I have an international credit card, if needed.)

Thanks in advance,

```

Hi James!

The DNS_CACHE set to 64 is a good figure. I used a value of 128 for several months and did not see any advantage to it.

I've also had the problem of the DNS cache not loading on bootup in the past a few times; the latest time when I had DNS_SAVE set to FALSE. I had the problem when I first installed Sting 1.22 although it didn't last long and can't remember exactly what I did to fix it.

2494. 63,000 bugs and counting

Have you used Falcon speed. There is a DOS based browser. I recall you had
asked about a more modern browser for atari and that being in college a new
pc wasn't in the picture right now. From what i understand , the dos based
browser has rudimentary support for CSS and Javascript.

I have the same problem using Magic 6.01 or at least a similiar problem.
It seems to be ok as long as I don't have too many comilies with errors.
I've found everything seems to be ok to begin with but eventually I get
the "system halted" message. Unless anybody has a solution I'll just try
to remember to save the source file before every compile and reboot when
it locks up.

Yours

2501. 80 MEG virtual disk, Gemulator and Calligrapher

Newsgroup: comp.sys.atari.st
Date: 2000-02-18 00:00:00 UTC
From: Alyre Chiasson <epinoche@nbnet.nb.ca>
Message-ID: <38ADCCC4.B2081527@nbnet.nb.ca>
Source record: 65447

I have installed the Gemulator 2000 software and also have the internal rom card. Try as I might I cannot get Calligrapher Gold to properly install the 5th disk so it doesn't always ask for disk 1. Even when disk 1 is in the drive Gemulator doesn't recognise it. I though that maybe setting up a virtual disk would be a solution? However, perhaps I don't understand what a virtual disk really is? I though it was space reserved in memory. So how can Gemulator set up a default 80 MEG C drive on a 32 MEG machine (swap file?). Even so, how do I get my current Atari files on to this virtual disk? Once the virtual drive is set up I no longer have access to my Windows C parition to copy the files to the virtual disk. There is obviously something I am missing here.

Any clarification and solutions appreciated.

Alyre

No, only that ASH Emailer creates a proper delimiter. I'm surprised it generates one but doesn't cut the signature during a followup.

When I said to Steve it worked fine I meant that MacSOUP ignored his signature when I replied, so his newsreader created a proper delimiter. How this somewhat shaky standard is implemented depends on the many newsreaders out there. Like MacSOUP, Okami won't quote a properly delimited signature. But if the delimiter's trailing space is missing, or varies in any other way, these newsreaders will quote the signature (because they didn't see a valid delimiter). That trailing space is important.

>If thats's not possible can it be converted instead to a WAV file (without
>resampling)?

Spin! lists tracks on audio CDs as WAV files, they can then be saved to a hard drive as required. The only drawback is that they are huge!

Don't know about the practicalities of resampling to reduce the bitrate/size, it's possible but you'd need some specialised gear I'm guessing.

I wonder when we can expect CAB 2.8 to be available in the US?

>Cab 2.80: about 3 sec for the same jpg

Do you find the new jpeg_ovl with 2.8 loads _faster_ than the Falcon-
specific DSP-jpeg_ovl [that I currently use with CAB 2.7]? (you know, the
one that _doesn't_ support progressive JPEGs).

And what about rendering / formatting tables. Is CAB 2.8 any faster at this?

I use a wonderful little rackmounted MIDI Patch Bay made by Ensoniq called the KMX-16. It's a 15 IN x 16 OUT MIDI patch bay, and works very well with the Falcon. In fact, it even came with Atari (and Mac) software that allows graphically editing the various user preset patch routings (up to 99).

You can see a picture of it in the "RED LIGHT 6 STUDIO" section of my web site (URL in signature).

I also have a little MIDIman "Macman" MIDI interface box. It's designed for the Mac, but works with CAF since someone wrote a little MROS driver for it. It gives you an additional MIDI OUT through the Falcon's LAN port. However, I've not used it since I hooked up my FDI because the FDI drivers conflicted with the LAN driver. Oh well...

Hey John, looks like you used 2 "underlines" instead of 2 "dashes". And as evidenced by your signature showing up in the quoted portion of this post, "__" is not the same as "--"

8^)

CAB 2.7 does support progressive jpegs - it just does not load them a little bit
at a time.

Audio CD is raw 44,1 KHz PCM data with no file system. To save as WAV
file, you need dedicated grabbing software or a CD-ROM file system
which maps to "virtual" WAV files (then -- with a good CD ROM drive --
you can just copy the files over).

SPIN (http://www.muenster.de/~reschke/soft_e.html#spin) supports the
latter.

A FABULOU$ WAY TO TURN $6 DOLLARS INTO THOUSAND$
Thursday, 16 feb-2000

I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, "Yeah right, this must be a scam", but like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups (there are thousands). No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured, "What have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00. Well, GUESS WHAT!!... Within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made $25.00. By the end of the second week, I had made a total of over $1,000.00! In the third week I had over $10,000.00 - and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly. It was certainly worth the $6.00, and six stamps. I have spent more than that on a lunch!!

Let me tell you how this works and, most importantly, why it works....also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you ever thought possible by doing something so easy!

Suggestion: Read this entire message carefully! Print it out or download it. Follow the simple

directions and watch the money come in! It's easy. It's legal - and your investment is only
$6.00 (plus postage) .

IMPORTANT: This is not a scam; it is not indecent; it is not illegal; and it is virtually no risk - it
really works!!!! If all of the following instructions are adhered to, you will receive extraordinary
dividends.

PLEASE NOTE: Follow these directions EXACTLY and $50,000, or more, can be yours in 20
to 60 days. This program remains successful because of the honesty and integrity of the
participants. Please continue its success by carefully adhering to the instructions.

You will now become part of the Mail Order business. In this business, your product is not solid
and tangible, it's a service. You are now in the business of Developing Mailing Lists. Many large
corporations are willing and happy to pay big bucks for quality lists; however, the money made
from the mailing lists is secondary to the income which is made from people like you and me
asking to be included in that list.

Here are the 4 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper,
"PLEASE PUT ME ON YOUR MAILING LIST". Include your name and address. Now get six US
$1.00 bills and place ONE bill inside EACH of the 6 pieces of paper (so the dollar bill will not be
seen through the envelope - this is to prevent thievery). Next, place one paper (with the dollar
bill wrapped inside) into each of the 6 envelopes and seal the envelopes. You should now have
6 sealed envelopes, each with a piece of paper stating the above phrase, your name and
address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY
LEGAL! You are requesting a legitimate service and you are paying for it!

Like most of us, I was a little skeptical and a little worried about the legal aspects of it all so I
checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed
legal!

Put a stamp on each envelope and mail the 6 envelopes to the following addresses:

#1 Dr. Harry T.K.
273 Coe St
Tiffin, OH 44883-3159

#2) Samantha Bussey
113 McHenry Road #234

#3) Micheal Kolb
12217 Barbary Rd
Philadelphia, PA 19154

#4) Natalie Surkova
506 Society Place
Newtown, PA 19056

#5) Greg
1317 Bristol Lane
Buffalogrove, ILL 60089

#6) Lucie E. Wright
1848 Todd Drive
Arden Hills, MN 55112

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6
becomes 5, 5 becomes 4, etc.) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to the original as
possible. Now, post your amended article to at least 200 newsgroups (I think there are close to
24,000 groups). All you need is 200, but remember, the more you post, the more money you
make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the
Postal laws. Keep a copy of these steps for yourself and whenever you need money, you can
use it again and again.

PLEASE REMEMBER that this program remains successful because of the honesty and
integrity of the participants and their carefully adhering to the directions. Look at it this way, if
you are of integrity, the program will continue and the money that so many others have
received will come your way also.

NOTE: You may want to retain every name and address sent to you, either on a computer or
hard copy and keep the notes people send you. This VERIFIES that you

are truly providing a
service. Also, it might be a good idea to wrap the $1 bill in dark
paper to reduce the risk of mail
theft. As each post is downloaded and the directions carefully
followed, six members will be
reimbursed for their participation as List Developers with one dollar
each. Your name will move
up the list geometrically so that when your name reaches the #1
position you will be receiving
thousands of dollars in CASH!!!

What an opportunity for only $6.00 ($1.00 for each of the first six
people listed above). Send it
now, add your own name to the list and you're in business!

DIRECTIONS FOR HOW TO POST TO NEWSGROUPS

Step 1) You do not need to re-type this entire letter to do your own
posting. Simply put your
cursor at the beginning of this letter and drag your cursor to the
bottom of this document, and
select 'copy' from the edit menu. This will copy the entire letter
into the computer's memory.

Step 2) Open a blank 'notepad' file and place your cursor at the top
of the blank page. From the
'edit' menu select 'paste'. This will paste a copy of the letter into
notepad so that you can add
your name to the list.

Step 3) Save your new notepad file as a .txt file. If you want to do
your postings in different
settings, you'll always have this file to go back to.

Step 4) Use Netscape or Internet explorer and try searching for
various newsgroups (on-line
forums, message boards, chat sites, and discussions).

Step 5) Visit these message boards and post this article as a new
message by highlighting the
text of this letter and selecting paste from the edit menu. Fill in
the Subject, this will be the
header that everyone sees as they scroll through the list of postings
in a particular group, click
the post message button. You're done with your first one!
Congratulations...THAT'S IT! All you
have to do is jump to different newsgroups and post away. After you
get the hang of it, it will
take about 30 seconds for each newsgroup!

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200**

That's it! You will begin receiving money from around the world within days! You may
eventually want to rent a P.O. Box due to the large amount of mail you will receive. If you wish
to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

** JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT **

Now the WHY part: Out of 200 postings, say I receive only 5 replies (a very low example). So
then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent
me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons
respond to each of the original 5, that is another $25.00 for me. Now those 25 each make 200
MINIMUM posts with my name at #4 and only 5 replies each. I will bring in an additional
$125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3
and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part,
each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only
receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this
message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups
react, I will receive $15,625.00 with an original investment of only $6.00! AMAZING!

When your name is no longer on the list, you just take the latest posting in the newsgroups,
and send out another $6.00 to names on the list, putting your name at number 6 and start
posting again. The thing to remember is that thousands of people from all over the world are
joining the internet and reading these articles everyday JUST LIKE YOU are now!! So, how can
you not afford the $6.00 to see if it really works?? I think you can't afford the opposite - to not
give it a try. People have said, "What if the plan is played out and no one sends me the
money?" So what! It's only six bucks. What are the chances of that really happening anyway
when there are tons of new honest people who are joining the internet and newsgroups
everyday and who are willing to give it a try? Estimates are at 20,000 to 50,000 new users,
every day, with thousands of those joining the actual internet.

Remember, play FAIRLY and HONESTLY - We're all on this planet together
and we're here to
love one another. Can you think of a better way than to treat one
another kindly and to share
the wealth?

It seems to me that one of (rare) drawbacks of Gemulator is its
inability to map folders into "drives" the way PaCifiST and TOSBox do.
In my opinion that is a very handy way of keepeng Atari files out
of the way when using Windows, and vice-versa.

I have mapped folders into Atari "drives" from Windows itself (SUBST...),
but although Gemulator sees such "drives", I did not succeed to boot
the emulated computer from them. So all the Atari startup stuff
(MAGIC_PC.OS, AUTO folder, DESKICON.RSC, NEWDESK.INF, *.ACC, etc.)
is in the root of the "real" C-drive,, which is not very handy, indeed.
Any suggestions how to do it better?

I promise you that if you follow the directions exactly, that you will start making more money than you ever thought possible by doing something so easy!

Suggestion: Read this entire message carefully! Print it out or download it. Follow the simple

directions and watch the money come in! It's easy. It's legal - and your investment is only
$6.00 (plus postage) .

IMPORTANT: This is not a scam; it is not indecent; it is not illegal; and it is virtually no risk - it
really works!!!! If all of the following instructions are adhered to, you will receive extraordinary
dividends.

PLEASE NOTE: Follow these directions EXACTLY and $50,000, or more, can be yours in 20
to 60 days. This program remains successful because of the honesty and integrity of the
participants. Please continue its success by carefully adhering to the instructions.

You will now become part of the Mail Order business. In this business, your product is not solid
and tangible, it's a service. You are now in the business of Developing Mailing Lists. Many large
corporations are willing and happy to pay big bucks for quality lists; however, the money made
from the mailing lists is secondary to the income which is made from people like you and me
asking to be included in that list.

Here are the 4 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper,
"PLEASE PUT ME ON YOUR MAILING LIST". Include your name and address. Now get six US
$1.00 bills and place ONE bill inside EACH of the 6 pieces of paper (so the dollar bill will not be
seen through the envelope - this is to prevent thievery). Next, place one paper (with the dollar
bill wrapped inside) into each of the 6 envelopes and seal the envelopes. You should now have
6 sealed envelopes, each with a piece of paper stating the above phrase, your name and
address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY
LEGAL! You are requesting a legitimate service and you are paying for it!

Like most of us, I was a little skeptical and a little worried about the legal aspects of it all so I
checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed
legal!

Put a stamp on each envelope and mail the 6 envelopes to the following addresses:

#1 Dr. Harry T.K.
273 Coe St
Tiffin, OH 44883-3159

#2) Samantha Bussey
113 McHenry Road #234

#3) Micheal Kolb
12217 Barbary Rd
Philadelphia, PA 19154

#4) Natalie Surkova
506 Society Place
Newtown, PA 19056

#5) Greg
1317 Bristol Lane
Buffalogrove, ILL 60089

#6) Lucie E. Wright
1848 Todd Drive
Arden Hills, MN 55112

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6
becomes 5, 5 becomes 4, etc.) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to the original as
possible. Now, post your amended article to at least 200 newsgroups (I think there are close to
24,000 groups). All you need is 200, but remember, the more you post, the more money you
make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the
Postal laws. Keep a copy of these steps for yourself and whenever you need money, you can
use it again and again.

PLEASE REMEMBER that this program remains successful because of the honesty and
integrity of the participants and their carefully adhering to the directions. Look at it this way, if
you are of integrity, the program will continue and the money that so many others have
received will come your way also.

NOTE: You may want to retain every name and address sent to you, either on a computer or
hard copy and keep the notes people send you. This VERIFIES that you

are truly providing a
service. Also, it might be a good idea to wrap the $1 bill in dark
paper to reduce the risk of mail
theft. As each post is downloaded and the directions carefully
followed, six members will be
reimbursed for their participation as List Developers with one dollar
each. Your name will move
up the list geometrically so that when your name reaches the #1
position you will be receiving
thousands of dollars in CASH!!!

What an opportunity for only $6.00 ($1.00 for each of the first six
people listed above). Send it
now, add your own name to the list and you're in business!

DIRECTIONS FOR HOW TO POST TO NEWSGROUPS

Step 1) You do not need to re-type this entire letter to do your own
posting. Simply put your
cursor at the beginning of this letter and drag your cursor to the
bottom of this document, and
select 'copy' from the edit menu. This will copy the entire letter
into the computer's memory.

Step 2) Open a blank 'notepad' file and place your cursor at the top
of the blank page. From the
'edit' menu select 'paste'. This will paste a copy of the letter into
notepad so that you can add
your name to the list.

Step 3) Save your new notepad file as a .txt file. If you want to do
your postings in different
settings, you'll always have this file to go back to.

Step 4) Use Netscape or Internet explorer and try searching for
various newsgroups (on-line
forums, message boards, chat sites, and discussions).

Step 5) Visit these message boards and post this article as a new
message by highlighting the
text of this letter and selecting paste from the edit menu. Fill in
the Subject, this will be the
header that everyone sees as they scroll through the list of postings
in a particular group, click
the post message button. You're done with your first one!
Congratulations...THAT'S IT! All you
have to do is jump to different newsgroups and post away. After you
get the hang of it, it will
take about 30 seconds for each newsgroup!

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200**

That's it! You will begin receiving money from around the world within days! You may
eventually want to rent a P.O. Box due to the large amount of mail you will receive. If you wish
to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

** JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT **

Now the WHY part: Out of 200 postings, say I receive only 5 replies (a very low example). So
then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent
me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons
respond to each of the original 5, that is another $25.00 for me. Now those 25 each make 200
MINIMUM posts with my name at #4 and only 5 replies each. I will bring in an additional
$125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3
and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part,
each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only
receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this
message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups
react, I will receive $15,625.00 with an original investment of only $6.00! AMAZING!

When your name is no longer on the list, you just take the latest posting in the newsgroups,
and send out another $6.00 to names on the list, putting your name at number 6 and start
posting again. The thing to remember is that thousands of people from all over the world are
joining the internet and reading these articles everyday JUST LIKE YOU are now!! So, how can
you not afford the $6.00 to see if it really works?? I think you can't afford the opposite - to not
give it a try. People have said, "What if the plan is played out and no one sends me the
money?" So what! It's only six bucks. What are the chances of that really happening anyway
when there are tons of new honest people who are joining the internet and newsgroups
everyday and who are willing to give it a try? Estimates are at 20,000 to 50,000 new users,
every day, with thousands of those joining the actual internet.

Remember, play FAIRLY and HONESTLY - We're all on this planet together
and we're here to
love one another. Can you think of a better way than to treat one
another kindly and to share
the wealth?

>1 is in the drive Gemulator doesn't recognise it. I though that maybe

Perhaps the drive has problems reading the disk? Is the program
copy protected? If so, maybe the the pc can't handle it?

Try to make a copy of the disk. If that works, try to install with the
copy. If it's really copyprotected you may have to find a cracked copy
instead.

>setting up a virtual disk would be a solution? However, perhaps I don't
>understand what a virtual disk really is? I though it was space reserved

A virtual drive is a huge file in the Windows environment that
Gemulator treats like an Atari harddisk.

>in memory. So how can Gemulator set up a default 80 MEG C drive on a 32
>MEG machine (swap file?). Even so, how do I get my current Atari files

Atari TOS does not use swapfiles internally. You simply get a virtual
(not physical!) harddisk on partion C in the desktop. You may have to
install the drive icon in the normal Atari manner too.

>on to this virtual disk? Once the virtual drive is set up I no longer
>have access to my Windows C parition to copy the files to the virtual
>disk. There is obviously something I am missing here.

No. Gemulator can be runned in two modes:
1. Using the normal Win harddisks, floppys, cdroms etc. directly. This
means you Atari files will mix with Windows files. This mode is less
compatible with how a genuine Atari works. You may have problems
sorting the AUTO folder etc. I have also had problems with Atari
programs (written by myself) that tries to read a file up to "end of
file" leading to program errors.

2. Using virtual drives. These behaves exactly like normal Atari
drives. Also the floppy may accept more strange formats? I had to use
this mode to get the STinG network run with Gemulator. In this mode
all Atari files are kept separated from Windows ones.

In 1. you can copy and delete files at will all over the pc harddisk.
But you should avoid copying pc files with long filenames.

In 2. You have a totally separate Atari inside the pc. Only the floppy is shared. NOTE that this can lead to data corruption! Windows does not recognise changes written to the floppy by Gemulator. Always remember to take the floppy disk out and reinsert it so Windows thinks it has been exchanged. In this mode you install programs just like on a real Atari by using floppys. To copy a file to/from the Windows environment you also have to use a floppy. If you have a real Atari (with harddisk) too, you can off course also run a terminal program on both computers and copy files using zmodem and a nullmodem cable. Even possible to share drives with tcp/ip and BNET or by using ftp, but needs a bit more configurations to work.

<news@seedy.freeserve.co.uk> writes
>Wow, really? I've had the infamous ghost virus many a time. It's pretty
>annoying, but does nothing to your computer or software, as long as you
>kill all traces of it.

I wrote a little program several years ago, as I was fed up of people sending me viru's and when found out it was too late (Ghost virus). You then can't remember what disks were used etc. and going through a few thousand disks was no longer fun.

What was needed was a program that allowed detection of a virus, like a boot sector virus checker, but would run AFTER the boot sector as some virii hide themselves.

It also allowed IMMEDIATE repair of the boot sector, WITHOUT having to go through virus a checker. Which is brilliant if you working with floppies and can't leave them write protected.

You are informed at boot up if something is wrong with the boot-sector! Kills the buggers dead in the tracks, and has saved me and other users hours and many disk software.

Hence Ghostbuster - the boot sector integrity checker was conceived.

Version 1.6 is the latest, I've not had time to continuing work on v2.0 which I was hoping to incorporate other idea's, but NOT taking anything away from the UVK; why invent something that exists as UVK is THE B E S T virus checker on market EVER released.

I wrote the utility before getting my hands on a hard drive, so it only checks the boost sector on drive A. Read the instructions carefully for hard drive users and DON'T install it on your hard drive auto folder!!!

This was meant to be shareware, nothing in the program is restricted.

If there's enough interested I'll stick it on the LaST PD's web site for downloading:)

I'm switching hard drives around on my Atari so it's not accessible at the moment.

|Hi,
|I am using STinG 1.20 without much problems.
|Can anyone tell me why I should update to version 1.22 ?
|.

On my TT, Sting 1.22 is quite a bit faster than 1.20 was. It's not uncommon to get downloads of 10,000+ bps with Magic6 using Dan Ackerman's overlay 1.3101 optimized for the TT,Falcon. This is early in the morning when most people are still asleep. Evening speeds vary somewhat from an average of 4500 up to around 10,000; still very acceptable speeds.

Don't know about other Atari computers though.

In article <1a79dc0f.5b8b7a85@usw-ex0108-063.remarq.com>,
atarigalen <kNOk@SPAM@uia.net.invalid> writes:
> The way I see it, the receiving computer has to be outside a
> company's firewall for me to access it. So my data (which gets
> decrypted before storing, as likely as not) is sitting for some
> time on a computer that is open to attack.

Not necessarily. Only the receiving computer's https-port has to be
accessible thru the firewall(s), but it does not have to be outside the
firewall. This reduces the risk to the firewall being broken, or the web
server (or some CGIs running on it) having a severe security hole. And
even then there are ways to protect data from access.

> However, I perceive the Internet as being significantly more risky
> than the telephone right now.

I don't think so. I think it's far more risky to give your credit card
away for paying in a restaurant, or to be tricked into giving the
information to the thief yourself ("social engineering").

Of course, I don't say (and I've already stated that in the previous
posting) that using https alone will be enough to offer ultra-secure
online banking and such. It needs a well-designed overall security
concept, where SSL is only a small part of.

But even with the best security concept you can think of (inside or
outside the computer world), you're busted when the weakest part in it
(the humans) makes an error, gets bribed or blackmailed, decides to seek
revenge after being fired, ...

Ciao

Thomas

I can't resist asking -

If the folks over at http://www.newdealinc.com can get a 286 with 640k RAM on the Net with a browser (that looks great) , why can't I get something running on my 1 meg 520? I know I know - CAB will run from a floppy on a 1 meg machine. But have you seen it?

not trying to make your offer worthless but if someone wants to run Cubase
on a laptop all they need to do is get the program and a midi adapter,
Stacys are nice old machines but I wouldn't think they were worth the same
as a Pentium 200 laptop

Hi Alexander,

AS>I wrote a long text 8 years ago on Atari 1024ST and saved text on
AS>diskettes together with a text program called SIGNUM.
that's a pity for Signum (I guess it's Signum!2) was compatible only
to itself!

AS>Now I would like to open the text on PC but cannot.
No surprise at all!

AS>Tried to use emulator and got folders but cannot open it because PC
AS>does not recognize SIGNUM with SDO extension.
If the emulator is MagicPC, it should work with a Signum version !3 or
higher (the actual one should be 4.4).

AS>Maybe the best choice would be to find Atari computer, open the file
AS>and convert it to any PC recognized file or send the text to my
AS>address by e-mail.
Right, that will work, but the only possibility will be export to an
ASCII file and a reimport of that ASCII file to any PC text program,
but that means loss of all formatting (boldface, italic, tables,
columns etc...)

AS>Is there anybody in Toronto area willing to help me? Any suggestion
AS>will be welcome.
Or you send it (via e-mail) to any Signum user if there's someone to
do the job for you.

You are partially right here. When I use Gemulator, I can see the files and file names. When I click property I can see how big file is. When I click copy (edit/copy as a text) it really copies but could not paste text anywhere. It seems I need SIGNUM (a very old text processor for Atari) for my PC to run the text or I need Atari computer where I can use SIGNUM from diskette.

Hello!

I'm in the process of disassembling my Stacy to install a bigger
hard-disk, but ran into one stumbling block: the display's wire
harness. It is too short to easily move the top assemby appart,
or even to access the connectors. What's the trick?

Maybe I need to give you better explanation. When I click copy (edit/copy as a text) it start to produce noises like it copies, but when I try to paste it in Word processor the result always looks like this:"sdoc0001" with no matter what file I use to copy and how big it is. It is not even the file name. I do not know what is this.

This page that Vidar "Hawk" Olavesen has created is a valuable
resource. I have to say that I have dealt with numerous people over the
internet, and all those people except one were honorable in that they
did what they said they would do, or at least tried to make some
retribution with sincerest apologies.

Know that we can not only warn each other of that occational thief
in the fold with this web page, but there is now a Comsumer Protection
Division to file a formal report. I am filing such a report, and after
message from Vidar below, I will mention more information about the one
bad trader I have encountered in my tradings. Again, my thanks to the
rest of you for making the Atari experience a fun one.

Doctor Clu

@>-->--------------------

Trader name: Ron & Mary Schwab
Alias: "Qtip"

Address: 855 L Street
Gering, NE 69341

E-Mail address qtip@scottsbluff.net
qtip@excalibur.scottsbluff.net

Confirmed by drclu@swbell.net

Background story:
Back in late October'99 the the trader known as "Qtip" announced
that he/she was selling a bunch of Jaguar equipment and claimed to have
two catboxes.

Made a deal to buy a Catbox, & Dragon's Lair CD + shipping for
$50. Payment was sent out, and check was cleared in early November.
Weeks passed, and then upon asking, I was told the plumbing had backup
in the back room where the games were and they need testing.
Realizing the time it would take, asked for a refund to be sent
and that we would try the trade later when everything was cleaned up.
"Qtip" promised refund. After that, weeks would pass, then questions
asked answered with promises of refunds being sent. Finally in late
December the trader in anger said that a refund was sent with a money
order, and unprofessionally said no money order number would be given to
track the money order, nor would any other responses be given to the
status of the refund.
Currently in February I have yet to see the refund, and the trader
no longer replies to E-mails.

I am currently filing a formal report with the Consumer Protection
Division which is a branch of the FBI. If anyone else has had any bad
business dealings with the trader "Qtip", please send E-mails to:

drclu@swbell.net

Thank you for your time,

Doctor Clu

Hi Charles,

>I have the distinct impression that, until Texel 2.xx has been
>professionaly 'audited' for its mathematics, formulas etc, it will not
>be released in English -- I will not name names!
Of all the translations the D&D crew did so far, Texel probably has been the program where we've spend most time and efforts on. We can't guarantee that Texel is bugfree, but let me assure you that the formulas, expressions and mathematics have been checked very carefully by two teachers, who know their job...
We put a disclaimer in the archive, not because we think that the "maths" contain errors, but simply because the nature of the program doesn't make it possible to test every single formula, expression etc...
D&D will *never* spread a translation of which we're not for 100% certain that it is OK. One of the reasons D&D exists is because there are too many sloppy translations around, we have absolutely no intentions of adding some more to the list...

BTW, if you want a "professional audited" Texel, I think you'll have to wait until kingdom comes...

Cheers from Belgium
Dennis

>>Kellis) might be able to help.
>
>Yeah so have I! I'll contact her, though it's most likely that it only
>works under MiNT, and I have MagiC.
Yep, Katherine reported this here a while ago , it only runs under MiNT and
she also added that on a Falcon it takes quiet some time...

>>I could have sworn that a CD WAS basically WAV. In any event,
>>Extendos allows saving an audio CD as WAV.
>
>Any idea how? I have an old installation of Extendos to run my ancient 2x
>CD Rom, but perhaps I need Extendos Gold?
I haven't got a clue about Extendos, but I do now that when using SPIN, this
is a piece of cake.... the tracks of an Audio CD are displayed as WAV files,
so you just have to drag them on to the harddisk....

They must be appreciated though. E-Bay they can go for quite a bit. Seen Falcon's and TTs go for go for 1000's. I think it's a bit much since I can get a PC with a Sound Blaster Live Platinum for under 1000. But, I don't have

1000 dollars so I'm getting me STs to do my sequencing dirty work... Now for something to do sampling and recording....

Maybe the disk is "superformatted" with 11 sectors/track? Just tried here with such a diskette and Win-95 could sort of read it getting the file icons up and actually also could write a short file and then read it again. But I got lots of cryptic error messages. Windows is really not very user friendly when something goes wrong. When testing with Scandisk I got even more strange error reports.

What about http://www.emulators.com/ ? I think he has a file copy tool you might try.

Appreciated by some, still appreciated by few. Bottomline as an accepted household computer for everyone, I would have to say no. This was the domain of the IBM PC and then the Mac. A case could be made for the Amiga. But all in all, I don't believe the ST ever got its fair recognition in the USA or in North America. In Canada monitors where back ordered and in the USA most Atari computers where shipped overseas. The dealer base was never as strong as in Europe and Atari US didn't give the dealers alot of support. Atari IMHO lost focus when trying to make a PC line. I don't think these helped Ataris Position in the USA. Therefore I can only conclude that it diverted resources that could have been put toward the ST or the much delayed TT.

I think anyone giving away an ST appreciates it. It's not like it is being sent to the dump. In many cases STs were second class citizens in a users home when a 386 was purchased. Therefore alot of Ataris have been sitting in closets for many many years.

I honestly don't believe that many North Americans have any idea how far the ST software was developed after 1989 nor any idea of Atari computers that came after the ST. This is a very common experience for me as I meet former Atari users who can't believe that Ataris are still being used by people. Even more puzzling to them is that there are Atari based TOS computers still being developed and supported.

Anyways, I don't want to burden Johns dog too much, but I think I will go for the 1040ST for free and see if I can make a paper airplane that can carry the 520ST. If successful, I will propel the plane with my good arm, as far as I can throw it, hopefully to YU.

Ermm, should I try hotair inSTead;-).

Actually, I don't need anymore STs, well maybe another 1040ST. But other than that, I have far to many STs. All gathered from adds such as this or a nominal fee.

Later Brian.

Biting STatement.

But Pera, I know you have no room for another ST. I mean where would you put it? I think I even offered you one at christmas and you didn't think it was worth the price of your labour;-).

Besides, the computer has that stupid Y2K bug;-).

I was wondering if you expect the Atari to be dropped from the same height as the bombs? IIRC the Atari only requires a 4 inch drop to reseat the chips. Anything greater than this and you may require a real service tech to fix the Atari.

Becareful with these Ataris, they are classic computers and must be treated with the greatest amount of care. I am not certain if dropping it from a plane is such a good idea . While I would like you to get another computer, I think I could use one more. Especially if it is free. Hopefully John will get his untrainable dog trained and it will carry the relic across the border safely and in one piece. I will perform the 4inch drop myself.

I would offer his dogs services to deliver the package to you, but I have the impression that the dog is neither a strong swimmer nor does he have his pilots license.

Later Brian.

If you used a 1040ST to format the disks, it's likely the problem is
that the PC cannot read the disk format.

Back at the dawn of the ST, floppies formatted on an IBM system could
be read on both an ST and the IBM, but the opposite was not true.

A disk formatted on an ST (as yours were) could not be read on an IBM
because of an error in the ST format routines. Three bytes in the
disk headers were incorrect, preventing the DOS system from
recognizing the disk properly.

There are a number of IBM utilities which could read files from Atari
formatted disks and allow them to be transferred to an IBM disk. One
I used years ago was called ST2PC and another one (or possibly just
a different name for the same thing) was STTOPC.

I think there's a utility on the GEMulator website that allows the same thing, though it's been a long time since I've looked there.

I can't explain why GEMulator wouldn't copy the files, I thought Darek made that work a long time ago. It's possible the disk is just unreadable because of its age. That does (unfortunately) happen.

Those ST to IBM PC file copy programs used to be available on Atari archive sites. You might give them a try to see if you can at least recover the files.

From: BobF <BobF@techsoftware.freeserve.co.uk>
Message-ID: <88pj0h$a2d$1@news6.svr.pol.co.uk>
Source record: 65495

Hi,

I have a STe with an external SCSI drive linked via an
ICD interface. If I switch on the drive, then the STe it
usually fails to boot - although several resets cures this.

However if I leave the hard disk switched on for about
3 minutes before switching on the STe - everything boots
fine - first time.

Any clues as to what might cause this?

Regards

Bob

Well, they can't all have the same file name....

CAB automatically loads CAB.OVL in the MODULES folder. If the others
have different names, CAB doesn't recognize them as the overlay file.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Don't try to open them at all on the PC in any editor.

Do this:

1) See if you can find someone with SIGNUM still running on their ST (anywhere in the world) that agrees to do the conversion for you.

2) Write an E-mail to that person, and enclose the files in that E-mail as Attachments (you can attach any file of any type, even if the PC can't understand its contents).

3) The other person can save the attachments, use SIGNUM, and E-mail the resulting text files back to you. Again as Attachments.

4) You will then be able to open the Attachments on your PC.

2574. Dolmen, Cecile etc

Newsgroup: comp.sys.atari.st
Date: 2000-02-21 00:00:00 UTC
From: Peter Persson <pep@REMOVEmbox306.swipnet.se>
Message-ID: <N7Bs4.4806$7f7.10551@nntpserver.swip.net>
Source record: 65306

Hi!

Please write to Class4, perhaps we could get them to release the sourcecode
for Dolmen, Cecile etc so we could continue the development. It would be
such a waste if this software just "died" after 3 years development.

(The following text is from Rodolphe Czuba, author of Centurbo II and
Phoenix)

If you want to contact the authors of Dolmen, Cecile, Sandrine, and
CT2 software,
or if you are not happy about their decision to stop the Dolmen and Phenix
work,
you can write to :

class4@freesurf.fr

It should be possible for WordPad to open a file with the SDO
extension ... here's what I would do.

1. Start WordPad (Start, Programs, Accessories, WordPad).

2. Select "File", "Open" from the menu bar.

3. In the dialog, change "Files of Type" to "All Documents".
Then change "File Name" to "*.SDO" -- remember to press ENTER.

4. Click on the SDO file of your choice, then click on "Open".

If this does not work, please let us know which step (above) fails!

It works but the text is under cover or not readable. The text starts with:
"sdoc0001" and continue with non recognizable symbols. When I try to copy
and paste it only "sdoc0001" appears. The reason might be in fact I did not
use standard fonts.

Yes, thanks for detailed explanation. I read similar things in magazines
in 80-es & early 90-es.
I read also that Ataris were available in music shops, and not in computer
stores in USA.

Yo eric,

Like the Doc says, "Quit kick'en yourself in the butt, there's plenty of
other people who'll do it for you." (I couldn't resist <g>)

Bottomline, at least get a HD for that 1 megger. Writing cache data to a
floppy, well, is like kick'en...

BTW, Skipper Pro by NewDeal doesn't accept plug-in's. Java/JavaScript? Nope.

Hi

What I can make out is that the software is NOT going to be developed
any further by the author:(But the source and rights can be bought as
long as the entire setup is purchased.

I am still awaiting further details from the original person who posted
the article, so I can assume that the author hasn't got back to them.

2587. Atari and ZIP 250

Newsgroup: comp.sys.atari.st
Date: 2000-02-21 00:00:00 UTC
From: ai063@FreeNet.Carleton.CA
Message-ID: <88rhu1$i3h$1@freenet9.carleton.ca>
Source record: 65372

I have a ZIP250 chained (after 2 SyQuest 230s) to mu 1040STe. The ZIP autoparks after about a minute of non-use. The ZIP manual says it should do this after 15 minutes and the time is adjustable using the software that came with the ZIP.

Unfortunatel, that software is set up for IBM compats and the Mac. Not much use to an Atari user. Does anyone know of a way I can extend the autopark delay to, say, 5 minutes?

Any helpful suggestions will be appreciated.

>Hitatchi CM2198ME 21"

Only if they have a digital ECL input in addition to VGA analog. If these
are colour monitors, then I doubt it.

You can use normal VGA colour monitors in the TT colour modes, but I guess
that you want 1280*960 and not 640*480 on a 21" display, so you need a
monitor with ECL input on a TT.

2594. Falcon upgrade choices?

Newsgroup: comp.sys.atari.st
Date: 2000-02-21 00:00:00 UTC
From: Brian Hutchinson <brian.hutchinson@ericsson.com>
Message-ID: <38B17E18.C3F99662@ericsson.com>
Source record: 65379

I'd like to upgrade my Falcon but there are so many options I don't know about:
Nemesis
Eclipse
CenTurbo II
Afterburner 040
PPC

The list goes on!

I want to speed up my system, get better video (true color and 1024x768 at least) and run various OSs like Linux, NetBSD, Minix, Mint etc. as well as TOS.

I currently have a Falcon 030 with one of the clock mods, two external SCSI drives and a external SCSI CD ROM. I still use the stock internal 80M IDE, although I would like to get the Wizztronics adapter and add a 3.5" IDE I have laying around.

Could someone knowledgeable about these upgrades tell me about the pros and cons about computability etc.? I'd like to hear from people who have some of these upgrades to hear about their experience.

The monitor I am using is a Mag 17". I think I might have a problem here too. I don't think this monitor will do ST low will it? Monitor help is appreciated too!

Thanks in advance,

Brian

2595. Falcon res

Newsgroup: comp.sys.atari.st
Date: 2000-02-21 00:00:00 UTC

Perhaps a couple of pixels to 512. However - you can get something like
1536x512 with a screenenhancer such as Videl Inside.

2598. HD Driver and GTLook

Newsgroup: comp.sys.atari.st
Date: 2000-02-21 00:00:00 UTC
From: scornio@erols.com
Message-ID: <38b18055.18881825@news.erols.com>
Source record: 65383

I have an Epson ES-100C scanner which I have been using with my Falcon. I recently upgraded my internal drive to a Hitachi DK227A-41, which is a 4GB ATA-3 drive. My trusty ICD Pro software refused to see this drive so I switched to HD Driver 7.55 as my boot software. Now the problem is that HD Driver sees the Epson but GT Look does not. If I boot from floppy, GT Look sees the scanner. If I connect the scanner to my second Falcon with the old hard drive booting with ICD Pro, GT Look sees the scanner. ID check in HDDRUTIL reports the scanner as 'EPSON SCANNER GT-8500 1.26 Processor' on SCSI ID-6, which is what the scanner is set to. I have tried SCSI Arbitration on and off. I have tried enabling and disabling SCSI ID 6 under Device Configuration. I have tried using different SCSI IDs. HD Driver always sees the scanner and GT Look never does. All of this testing was done with the scanner as the only SCSI device on the chain.

On a second note, I also bought a Toshiba MK4313 MAT drive, which is a 4.3 GB ATA-4 drive. None of the boot software that I have will recognize this drive, not even HD Driver. Does anyone know if ATA-4 drives work with Falcon computers?

> usually fails to boot - although several resets cures this.

It could be that the HD is taking longer to start up than the STe. Have you tried waiting different periods between SWON the HD and SWON the STe? If this sort of approach works you can get "wait" programs which you put in the AUTO of your floppy which will delay the STe boot-access to the HD by a variable number of seconds.

> However if I leave the hard disk switched on for about
> 3 minutes before switching on the STe - everything boots
> fine - first time.

.... OR your HD boot sector may be getting frayed! You could try re-installing the boot-code and driver (ICDUTILS) to re-write these much-used blocks.

The Afterburner is pretty stright forward, very compatible and fast.
It is also the hardest to find. There was a guy in Ireland that had
one for sale, and another popped up here not to long ago. You have to
watch often, and act fast. To get the resolution you want, you need a
ATI NOVA Video setup. No longer produced. The NOVA runs GEM and TOS
type applications only. Great for everything but games, ApexMedia, and
Demos. You can always switch it off for compatibility with those.
The CT2B would be a second choice, let the dealer fit the card. You
might get 800*600 TC, but no where near the speed of a NOVA set up. I
think that System Solutions still has a few. No longer made.
Forget the Nemesis, it was a nice first, but a lot of cutting on you
machine (So is the CT2). I doubt you will see an Eclipse, and if you
do, walk, drive or fly to purchase it, do not order it by mail. Same
with the PPC.
The A/B will work well with the O/S's you mentioned.
Your monitor likely won't do ST resolutions (didn't give enough info).
Sorry to say, your best bet is while waiting for an Afterburner or
NOVA to come up for sale is to pocket your money and wait for a Milan.
The AB is going to cost you, so would a NOVA. The CT2 is a reasonable
cost, but installation will bring up it's price too. Don't install it
yourself. The A/B is a simpler installation, but the software
configuration will drive you nuts at first:).
Just for a giggle, if someone wanted my A/B and I really wanted to
sell it, it would go for no less than $580.00. Laugh all you want, but
I wouldn't let it go for less. Same with the NOVA. You can have my
non-working CT2B for $160.00. I also have a Mighty Sonic, not the
fastest card, but reliable (the little brother to the A/B), it is worth
$350.00 to me. Best to be happy with the Falcon as it is, and get a
Milan.

```
You should allow the drive to spin up to speed before switchin on the STE,
however 3 minutes is a bit much.

I installed a CT2. I don't know how well it will work with the Eclipse, but
if the Eclipse works with the Nemesis, it should work with the CT2 as well
(But you will have to make a lot of solderwork to extend the bus of the
Eclipse)

> I currently have a Falcon 030 with one of the clock mods, two external
> SCSI drives and a external SCSI CD ROM. I still use the stock internal
> 80M IDE, although I would like to get the Wizztronics adapter and add a

Any 2.5-3.5" adapter will work, as long as you dont have a long cable (20 cm
maximum)

> Could someone knowledgeable about these upgrades tell me about the pros
> and cons about computability etc.? I'd like to hear from people who
> have some of these upgrades to hear about their experience.

The CT2=great. It is really fast, STABLE and a lot more compatible than
AB040.
Some software hangs (even in standardmode) - there is no DSP-IRQ. This can
be fixed with a software _or_ hardware patch. A bit tricky to install. The
CT2 speeds up the whole system (IDE, SCSI, DSP, Blitter, FPU)

AB040 has faster a faster FPU, but is slower in some other cases. It only
speeds up the CPU & FPU.. Don't know about installation..

The Nemesis has some hardware "bugs" (No printing in Nemesis Hi mode)
Speeds up entire system, but MO fastram. A LOT slower than the other two.
Don't know about installation..

PPC? I would love to have one, but will it EVER be finished?

Regards

PEter

It is possible to run Signum2 under Gemulator, but only under German TOS 1.0.
(It's typical for lot of German ST software).
I think that there is no other way, except via running Signum, to convert its SDO format to ASCI text, because Signum uses special (probably graphical) format of text.

To George Crissman: your steps were OK, but not idea :-) .

Terry,
"throwaway money" was meant to be symbolic (as in funds set aside from the successful operation of a company, household, etc.; money earmarked for investment or gambling as in Hasbro buying and promoting Atari games!!!).
Was that a 'sure thing'?
Like if I had Gates' money, I would "resurrect" the Atari computer and hire all the current and past programmers (those willing, of course) just to be a pain in the butt to the rest of the IBM/MAC/IBM/MAC/IBM/MAC/ world!!!
(remember, this was MY fantasy).
22,753 downloads from one site, based on nostalgia, must be from a good reputation and thus, the name Atari is being kept "alive" by Hasbro and those doing all that downloading! That, to me, is "relavent"!
As far as TOS goes, am I wrong in stateing the Hades is TOS based or the Milan? That to me is "alive" even if on life supports!
And at this point (having beat the livin' daylights out of this thread), I'll leave you with the last word if you chose! Thanks for the one-on-one!
John G.

I've been keeping out of this one, because I've never even seen Signum,
let alone used it. However, doesn't Papyrus import Signum files? You
could then export them to RTF for loading into a PC program.

OTOH, Papyrus is expensive if all you're going to do is use it as a file
converter...

I seem to recall that the feature was there under Extendos
Original, but it didn't work. Under Extendos Gold I just choose
a track, a start time, and a finish time and hit "Save".
Those .WAV files do get big, though. Since a data CD holds
around 650Mb, a rough estimate is 1Mb per 6 seconds of sound.

Pull the "Stacy 4" label from just below the screen. You will
find screws. Disassemble the top (screen part) of the computer
first and the wire harness will be quite a non-issue. (Learned
that trick from Alex Yu at ATY.)

Take the cable off your printer and look at the "printer" end.
This is called a "Centronics" adapter. The SCSI adapter is
also "Centronics", only a bit larger.

The Link is a hardware device about the size of a floppy disk
(only thicker). It is often found attached permanently to a
cable. If your hard drive has a Centronics SCSI port and you
can connect it to your ST, then you have a SCSI adapter (though
it sounds like it might be an internal one). Describe the
ports, and I'll try to help.

Most "direct to disk" recording software will record a .WAV file
from an audio input. The problem is getting it to .MP3.
Katherine Ellis has posted that she can do it, but I know not
how.

It works well with DOS 3.3, but note that you have something
approximating a 4Mhz 286 (I'm guessing at the speed...how do you
test it?) It's usable for Quicken for DOS 8.0, but it is slow.

I ran a Mag 17" (MXF, I think) on my Mega4STe for a while and while it
had a great range, no - it wouldn't do ST low. I was running it through
a Crazey Dots II and it did do a great 800 x 600 at around 100Hz.

As far as I know: Atari reads PC discs, so you don't need a
conversion program. However having said that, a PC will not read a
disc that has been formatted on a "standard" St desktop. However
there are Utilities and desktops that allow you to format DOS on an
Atari. Neodesk comes to mind with the different formatting options.
However, best solution is to use 720K discs formatted on a PC, or
store-purchased. Hard to find DS 720K discs these days though.

Hope this helps

Use standard 720K DOS formatted floppies. If this doesn't work, then maybe
the ST has an old single sided 360K drive, in which case there is virtually
no hope unless you upgrade the drive mechanism.

Check out the Quick FAQ!

HDDRIVER includes tools that allow to configure the ZIP's auto-sleep and
auto-park features as well as password protection.
As far as I know there is no other software for the Atari that does the
trick.

It's fine that you can download the demo from somewhere else than only
from my site. Note, however, that if you can access my official site I
recommend using this site for software uploads. Only the official site
guarantees that you get the latest version.

I can't comment on HDDRIVER 7.55 but only on the current version 7.8.
This version was tested by the author of GTLOOK and he confirmed that
GTLOOK works fine with the SCSI Driver integrated in HDDRIVER 7.8.

> On a second note, I also bought a Toshiba MK4313 MAT drive, which is a

They should. Maybe there are certain jumpers that have to be set? I
suggest that you simply give the current version HDDRIVER 7.8 a try. You
can use the demo version for a test:

For such a high resolution you would need an Eclipse. Otherwise you would probably slow down every
processor upgrade considerably.
Maybe you should try to get BlowUP FX card (about 350 DM) which overclocks 680EC30, the BUS, DSP and has a Fast RAM capabilities up to 10Mb if you only have 4Mb on the motherboard.
Together with Eclipse it could be a very nice upgrade.
However, you should see what's financially the best choice. There is no point paying too much.

>is great (no borders!), but can I improve upon the >vertical 480?

Steve,
You can use Videlity (E-mail me if you want it, it's Freeware) to extend you vertical res. However, it will
slow down the machine and, more important, bring a refresh rate that's very bad for the eyes.
Using the higher system clock (32Mhz instead of 25)
you can get 832 x 496i @ 58Hz
832 x 592i @ 50Hz
1280 x 496i @ 58Hz
1280 x 592i @ 49Hz
1664 x 496i @ 58Hz

Bye,

Nemanja.

Hi Peter,

It's the same with the Milan, the PRG files aren't there (on the CD),
but are an interface/artifice by Metados/Spin to enable you to play a
selected track. With the Milan, all you have to do is press the CDR play
button and the WAV tracks play sequentially.

Bob King.

Hi Peter,

The best I can get from my RGB monitor (no make ex laboratory) and Videl Inside, is 800x592 at 61Hz interlaced. The flicker is just about bearable. I had to adjust the vertical scan frequency to get the vertical lock and as the coil is invariably near to the EHT assembly, be very very careful and don't use a metal core adjuster. If you want my version of Videl Inside complete with resolution settings, just yell.

Going to a bog standard VGA however was a revolation, no flicker and much higher resolution. Try and get one from a skip somewhere.

Bob king.

Sorry I skipped past the original post. GT Look is unstable on the
Hades but because I have invested in an Epson (GT-5500) I am stuck
with it. I have four versions of GT Look and usually one will work
with the particular set up (auto folder, cpx etc). I have v105,
v109, v204 and v211. Usually v105 or 109 are best.

It you realy want to do your falcon up, I would say the choice is
an afterburner and a graphics card. Eclipse or a Nova (I think there are
still some Falcon Nova cards available). The one problem with this is
that you are looking at probably spending around $1000 US if you can find
all this stuff new still.

Why do you want to upgrade the Falcon? Music or sound? You might
want to look at getting a clone if you want just the atari compatibility
and speed. However we are back again to the price. Maybe one of these
days one of the clne manufacturer's will actually ship a good and not
overly expensive clone.

2640. Atari ST archive on CD

Newsgroup: comp.sys.atari.st
Date: 2000-02-22 00:00:00 UTC
From: Hellraiser <justin@hellraiser.demon.co.uk>
Message-ID: <H6ys4.175$oY2.4967@news3.cableinet.net>
Source record: 65325
Cross-posted to: uk.adverts.computer,comp.sys.atari.st

Automation, Pompey Pirates, DBug and Flame of Finland archives together on one CD, along with PC based ST emulators (Pacifist, WinSTon, Echo), TOS files and disk management tools, for dumping these images out onto floppy for use with a real ST! Stuck for a game? Chances are it's on here!

The price? 5 ukp including p&p in England, 6.50 ukp for Europe and 9 ukp for the USA.

Email justin@hellraiser.demon.co.uk if interested.

I'm a yell'in :-)
I'm using a Philips 8833 monitor (the original one), is this capable of doing over 768 horizontal res? I'm pretty much happy with 768x480 atm, but I just wanted to increase the virtical and make use of them white borders (unless I went to 60hz).

> Going to a bog standard VGA however was a revolation, no flicker and
> much higher resolution. Try and get one from a skip somewhere.

I have, though it's used for the TT. I like the Falcon on RGB, sure it's interlace, but all the demos work! And I've hundreds of the buggers :-)

Thanks, hopfully Bob will be sending this app.. A virtical res of 512
sounds about right to cover the top/bottom borders.

May I suggest upgrading your version of HDDriver? IME some earlier ones
didn't work as well with my Microtek SCSI scanner than others.

You could instead try running Steffen Engle's scsidrv.prg (it's part of the
CBHD PD hard disk driver software) before running your scanner software.

>On a second note, I also bought a Toshiba MK4313 MAT drive, which is a

My Toshiba MK22110MAT drive works perfectly on my Falcon, using any of the
more recent versions of HDDriver. Why not pop along to Uwe Seimet's web
site and download a demo? The URL was posted recently.

CBHD English docs can be found on my web site and there is a download link.

>(But you will have to make a lot of solderwork to extend the bus of the
>Eclipse)

Someone in this group has a web page showing several devices plugged into the Falcon's expansion bus via some IDC cable and connectors. I couldn't trace a supplier for the specific connectors he used here in the UK, but a little lateral thinking will show that all you need (apart from some space inside the Falcon's case!) are a couple of lengths of IDC cable, one IDC socket for each of the two connectors on the motherboard and as many plugs arranged along the cable as you have devices to connect.

I'm aware that there will be issues involved, but this seemed to be a workable solution.

I agree with your remarks on the CT2. By far the best investment I've made on upgrades.

from "BobF" <BobF@techsoftware.freeserve.co.uk> contains these words:

> Hi,

> I have a STe with an external SCSI drive linked via an
> ICD interface. If I switch on the drive, then the STe it
> usually fails to boot - although several resets cures this.

> However if I leave the hard disk switched on for about
> 3 minutes before switching on the STe - everything boots
> fine - first time.

> Any clues as to what might cause this?

> Regards

> Bob

Hi Bob

Yep -- I too am running the ICD Link SCSI interface. I have a
recased Megs 4ST in a pc desktop with an internal CDrom and 345Mb
Micropolis HD - connected via a Link 1, further connections using a
SCSI-1 cable to another pc tower case with a CDrom and 3 assorted Hds in it.

Boot up is as follows - switch on pc tower case, wait for 3-5 minutes
for drives to spin up, then switch on monitor, then the Mega - it
boots up into the floppy-only mode. Press 'reset' and then the ICD
Pro driver kicks in!

The reboot occurrs with or without the external pc tower conected.

It seems to be a fact of life with Ataris and SCSI. My wife's Mega
4ST behaves the same. It's still in original case with a Link SCSI
connector to a DataPulse external case.

HTH

Regards

Adrian tssf

HJ,

Atari used the original IBM disk format spec on their systems, but then Microsoft decided that DOS needed the system track to be formatted for the disk to be readable on their systems. The only difference therefore is that early Atari systems didn't format the system track; later Atari systems did. There are several programs in the public domain that will format only the system track on your existing diskettes without damaging the data already on the diskettes. That way, your diskettes will become readable on IBM compatibles as well as your Atari. Diskettes formatted on the IBM (except HD diskettes, unless you have a HD drive in your Atari) will be readable on both systems.

There are also programs that will format an IBM-compatible diskette on your Atari, readable by both systems.

As my CT2 doesn't work, and no reply from Centek, I could never verify
that the connector would indeed work with that card. Extending the bus
on the Mighty Sonic works fine. The A/B was a little more fussy about
length.

I don't think I really would, I just wanted to make a point people forget
that things like STacys and Falcons only have value in the Atari community,
to the rest of the computer world they are just old junk. The guy who
started this thread would have been better off just selling it and buying
the laptop he sought, a few years ago Stacys were like blocks of gold but
they seem to be going relatively cheap now

Just bought a new Iomega Zip 250 parallel.

Anyone put together a driver for this yet on atari?

Cheers,
Steve

I sent them an e-mail a week ago, but I have not received a response
yet. I am starting to use my Falcon again, and I want to upgrade it.
I did manage to get chro-Magic on the phone today. I am ordering
Extendos Gold and NVDI 5 upgrade from him, but he did not have HD
Driver. Does anyone know from where else I can order HD Driver?

Thanks,

Steve

It is not possible to use a Zip drive on the parallel port. It isn't a
matter of drivers, but a matter of missing lines in Atari's implementation
of what is mainly a printer port.

To use a Zip drive on an Atari, you need either a SCSI version, connected to
a SCSI host adapter, or a Parallel model connected to a special (and
expensive) parallel/cartridge port adapter available in Germany.

This is all in the Quick FAQ of course...

Someone asked this very same question a few hours ago. It is also in the
Quick FAQ.

The answer hasn't changed though: You can't use a Zip drive on an Atari
through the parallel port. You need either a SCSI Zip drive, or a
parallel/cartridge adapter. See the FAQ for details.

It only works with the cartridge interface also available on their web site,
which costs the price of a SCSI Zip drive.

> Would that make a difference?

You're refering to GTLOOK or the ATA drive right now?
Regarding GTLOOK in order to be able to use the SCSI Driver for a certain device the SCSI Driver option has to be active *and* the device's SCSI ID has to be active. All these settings are changed with HDDRUTIL according to the manual.
Regarding an ATA drive the drive ID has also to be active. Only those devices with IDs active in the "Devices and Partitions" dialog window can be accessed. Other devices are ignored by HDDRIVER, i. e. they cannot be accessed by HDDRIVER and also cannot be accessed by software using the SCSI Driver interface.
Regardless of these settings the ID Check function must find any device as long as it's connected to an Atari compatible bus. If a device is not found something is generally wrong, usually bad termination, bad cables or duplicate SCSI IDs.

You can always order the latest version (7.8) directly from me (with
German manual only) or from System Solutions (with English manual).

> I can't get Sting to work in any way.

Since you can get IConnect to work you shouldn't have any problem with
STinG.

I recommend that you download the latest version from
http://sting.atari.org and start again - remove all traces of your present
STinG setup before reinstalling. The CPXs seem to cause the most confusion:
you only need serial.cpx and sting.cpx (tick the "Active" box in the
latter).

AH> ICD Pro driver kicks in!

If you would like to be able to switch everything on at once or even the ST first, you could use a little program that will have the computer wait until the hard drive boots up. The program is called SCSI Wait. If you would like a copy of it, send me an email and I'll attach it to a reply.

Certainly does seem excessive. The instructions that came with my hard
drive said wait until the red light goes out and then switch on the
computer, about 20 seconds at most - I've just checked.

On my system, I don't know if it is TOS 2.06 or the Veloce board which
seems to detect when the hard drive is ready, as I switch on the hard
drive and then the STe straight away, there's the pause and then it loads
up OK.

>But that's probably my fault... I've tried everything...no use.
>Comments?

I use STing to connect to EUnet.yu (PAP) without problems- except that
SERIAL.STX V1.20 would not work with those of EUnet's nodes which have 56K
modems (but works with nodes that have 33.6K modems) . Surprisingly,
SERIAL.STX V1.15 works in both of those cases, so I use the older
STX instead.

This is on a Mega ST with an Intel 144/144e modem.

Upgrading from STing 1.15 to STing 1.20 and 1.22 later, required quite
a lot of reconfiguring of STing's files.

Well, I don't quite agree. I had a case of an IBM SCSI-II hard disk that wouldn't boot without an additional reset. But it turned out to be an improperly-configured hard disk (wrong setting for a "disable unit attention at startup" jumper). Now, when set correctly, it boots perfectly. (I use ICD driver and Ge-Soft host-adaptor). Another intermittent problem I had was the case of no drives (neither floppy, nor HD) appearing on the desktop after power-on. It seems to have been cured by adding a little TTL circuit in the HD case, which resets the HD for a few seconds on power-up.

I'm no expert on this stuff, but 3-5 minutes seems an excessive delay
for the drives to spin up. On my STE I have a Datapulse with a 170Mb
Quantum drive in it (as purchased), connected via a Link Mk 1. It takes
only a few seconds to get up to speed (you can hear it chatter t itself
and when it stops doing that it's OK to power up the STE). Less than 10
seconds, for sure. Once you turn on the STE it just boots, originally
with ICD (not pro version, though), now with HDdriver. Which makes me
thinks something is wrong in the above scenarios, though I can't shed
light as to what. You'd think newer drives would get up to speed at
least as quickly as old ones. My 6 gig in the PC spins up in seconds.

Just my two-penn'orth.

2693. FS: TT FastRam board with 4meg

Newsgroup: comp.sys.atari.st
Date: 2000-02-24 00:00:00 UTC
From: Lonny Pursell <root@bright.net>
Message-ID: <Pine.MNT.4.10.10002240109410.109-100000@TT030>
Source record: 65146

I have a FastRam board for a TT with 4meg already on it that I
no longer need. I pulled this from a working TT which I bought
for parts. It appears to have been modified, sipps replaced by
simm sockects? I can't say for sure as I've never seen one with
sipps, only read about them.

Part number is: CA400312-xxx

There are only 3 jumpers and I think the board is at it's limit.
Meaning it cannot be expanded beyond 4meg. The simms have the
word "Atari" on them and the board has burstmode enabled.
I'm asking $80 USD, buyer pays shipping. Would prefer to ship
within the US or Canada.

Thanks...

I think that what happened was that Milan paid for the licence to develop TOS, but nobody had the source code. Atari/JTS had lost it at that time (a few weeks before the sale to Hasbro). Then someone in Germany miraculously stumbled upon a copy of the TOS source code on a drive from an ex-developer's machine that he was just going to re-format. I've no idea which version this was.

> also have two other SCSI-2 HDs.

Most of the settings have to be done in your CD-ROM driver software. If
this software is based on the SCSI Driver interface you have to switch
on the SCSI ID in HDDRIVER and you have to ensure that the "Generic SCSI
Driver" option is also switched on. Everything else is not of concern
with respect to HDDRIVER.
In case your CD-ROM driver is not based on the SCSI Driver the settings
in HDDRIVER have no meaning at all since *everything* has to be set up
in the CD-ROM driver then.

You should order it from System Solutions in this case. The smaller the
Atari market gets (and it get smaller each day) the less likely it is to
get software from a distributor next to you. That's a fact,
unfortunately.

brian.hutchinson@ericsson.com wrote:
> I'd like to upgrade my Falcon but there are so many options I don't
know
> about:
> Nemesis

Out of production, difficult to install. I had to do a lot of tweaking
to mine (esp. the DMA-mod) to get it stable, but it worked very nice
once I found a stable setup.

> Eclipse

Probably nice, but it's impossible to find. Don't order it from Cortex
- you'll never get it. Try finding a Nova instead.

> CenTurbo II

I think they're out of production, but I could be wrong. I'm not sure
if I would recommend it though, as it's quite difficult to install. I'm
also not convinced that it works on all Falcons, Centek claimed it did
but I've heard a few horror-stories about it. The problem is most
likely that it speeds up the Falcon MB itself by 50% (and more in some
ways) which it can't handle over time. It could be a very nice product,
but IMO they over-estimated the Falcon's overclocking-capabilities.

> Afterburner 040

I have one myself, so naturally I'd recommend it ;-) However, it's been
out of production for almost two years so you'll have to look hard to
find one. It's a very nice accelerator though, by far the fastest
around and pretty easy to install. I've had mine for 2 1/2 years now,
and it has been extremely stable and reliable. Haven't had one single
problem with it, except that I had to change my Nemesis-setup quite a
bit to get the DMA working properly. Haven't touched the hardware for
atleast two years now, and this Falcon has been used a *lot*. It's
probably been used for atleast 4-5000 hours since I got it.

> PPC

Not available/doesn't exist.

> I want to speed up my system, get better video (true color and
1024x768

Not possible without a graphics-card.

> at least) and run various OSs like Linux, NetBSD, Minix, Mint etc. as
> well as TOS.

Then I'd say that an AB and a graphics-card is what you need. Or better (and cheaper) - a Milan ;-) Upgrading your Falcon will be fun, but you'll have a hard time to find the hardware and a Milan will probably be cheaper and have faster graphics.

> I currently have a Falcon 030 with one of the clock mods, two external
> SCSI drives and a external SCSI CD ROM. I still use the stock
internal

If you're using SCSI I'd recommend that you stay away from accelerators that accelerate the Falcon itself (i.e. CT2 and Nemesis). Despite what the manufacturers claims - the Falcon can not handle this in the long run. All hardware-problems I've ever had has always been traced back to the bus-accelerator, this especially applies to sound and SCSI.

> Could someone knowledgeable about these upgrades tell me about the
pros
> and cons about computability etc.? I'd like to hear from people who
> have some of these upgrades to hear about their experience.

All of these accelerators are more or less compatible. The Nemesis is definitely 100% compatible, the CT2 and Afterburner are less compatible. On the CT2 you can revert to a 16Mhz 030 with no fastRAM (which makes it atleast 99% compatible), this is not possible without additional hardware (basically a switch and a relay, take a look at http://atari.nvg.org/ab/) on the Afterburner.

However, the Afterburner is a lot more compatible that most people think, I have been using it for the last 2 1/2 years and have never bothered installing that AB/030-switch. I can't really recall having had any problems, but then I don't play games on my Falcon.

> The monitor I am using is a Mag 17". I think I might have a problem
> here too. I don't think this monitor will do ST low will it? Monitor

No, it won't. But why would you use that? Your monitor sounds fine to me, I wish I could afford a Mag!

Just posting this out there...

I am reviving a dead STe setup I have.. I had it in the Garage for a few years.. and wanted to get it up and running again..

One thing is - I have a FAST ICD interface and box. I have several SCSI HD around here.. from 100 meg to 500 meg. I am not sure anymore what it is that makes certain drives compatable or not.. can anyone help me out with that??

I could list the names and models of the drives.. and if anyone knows.. they could replay with yeah or nay. as to compatability

James

2705. SCSI CD ROM?

Newsgroup: comp.sys.atari.st
Date: 2000-02-24 00:00:00 UTC
From: biker_bob@geocities.com
Message-ID: <38b5238f.124885959@news.aci.on.ca>
Source record: 65158

Further to my revival of my STe..

I also have a 16x SCSI CD rom player.. what software do I need to make it workable in the ATARI?

And since I cant write to it and use it as storage.. is there really any point to hooking up the CD?? It is not my only PC and I work in the computer industry anyway..

Also I am running Rainbow TOS on my STE.. is this my overall best choice for primarly running games?? or is there an advantage to upgrading to 2.06??

James

2706. partition sizes

Newsgroup: comp.sys.atari.st

I know this has been asked a million times, but here goes..!

I've got a 4gb external HD that I'm using on both a Falcon and TT. I
want to simply partition it into 2 x 2gb partitions. Is this possible
under the TOS OS, or am I destined for problems?

I'm using TOS 3.06 on the TT and TOS 4.04 (with FPATCH2) on the Falcon.
I sometimes use MagiC, but mostly TOS on both machines.

Thanks
Steve

Hi Steve,

IMHO, Videlity, although its commercial and graphic and pretty, does not have the facilities of Videl. I'm thinking of the virtual screen mode on Videl. Say you are at 230X200X256 non-interlace at 50 to 60 Hz, rock steady picture, no flicker, but small, eg a quarter of CAB shows - all you have to do is click on a box and type in the virtual screen, I use 640X480 and you can scroll to view the whole 640X480. Videlity can't do that (at least I don't think it can).

I will send you VI on Monday when I'm back in the Office.

Your Phillips should be able lock into upto 60Hz, but for God's sake mind your knuckles on the tube EHT whilst turning the knitting needle core adjuster!!!! Looking at the screen with you hand blind inside the Monitor is a bit scary!

Bob King.

Hello,

The bigger partition with TOS 4.04 is 1gb, I don't know with the 3.06
(512 mb I believe).
If you want use more, you must install Mint (fat32, MinixFS,...)or Magic
(fat32), but you couldn't use TOS.
Otherwise you can format for exemple, the first partition (C) with 500mb
for compatibility between the Falcon and the TT; and the second (D) with
3,5gb (Mint or MagiC only).
Or 8 partitions of 512mb each...

No, this is not possible except when using FAT32 (MagiC, MiNT) or EXTFS2
(MiNT) partitions.
The maximum partition size for the TT is 512 MB, for the Falcon it's 1
GB.

2712. New Moving Pixels CD Web Site!

Newsgroup: comp.sys.atari.st
Date: 2000-02-24 00:00:00 UTC
From: kent@Systemsfortomorrow.com
Message-ID: <38b57d52.15561929@news-server.kc.rr.com>
Source record: 65165

We have just put up a web site for the Moving Pixels Collection CD.

http://www.spythis.com/mpc (Any links are appreciated.)

The CD is now only $9.95, and some software is available for FREE
download from the Web Site.

About the CD:
The MOVING PIXELS COLLECTION CD is an exciting compilation of original
Atari Programs from Tony Barker's Moving Pixels. All programs are
provided uncompressed, and many will run straight from the CD. The
programs on the CD also include FULL SOURCE CODE!

We can ship the CD Worldwide.

Thanks

I have five! But only 1 called cab.ovl - the others have version
numbers appended. Derryck showed me a neat trick: When I want to use
any one, I just drag it in its window to copy the file in the same
directory; I am informed there is a clash and can rename it in the
dialog to cab.ovl.

I wonder if its some hardware in the tower that is the culprit? I was using an external SCSI EZ 135 and another 320 MB hard drive with an ICD Link on my 4 MB STFM and had no such delay problems. Any drive taking minutes to run up probably has sticky bearings and is on its way out...

Source record: 65172

hello All:

I am happy to announce that GVOX has given me permission to have the Atari version of MASTER TRACKS PRO ver 3.6 as a free download on my site. All it took was emailing them with a request. A few weeks later, they sent me with a reply and an Attached licence agreement to release MTPRo at my site for Atari Users only. So I scrambled, made the page and wrote up a Tutorial, and it is now there.. WHEW!

Also, I was trying to convince Dr T (Emile Tobenfeld) to release Omega, But he said to go ahead and have the REAL version of TIGER CUB on my page. So I scrabled again, and it is there also. This is NOT the demo veersion that is available on most Atari FTP sites. This is the "real" version, and it's great! Also he said that OMEGA II is Still available from him, so that Info is on the page as well.

BTW..M and RealTime has also been released as freeware, and is at my site as well. Guess it's my mission in life to make OUR Atari midi apps into freeware. It's takes time and work, but you can be succesfull!

Atari was made for Midi! (or is it Midi was made for Atari!)

Anyway:

here is my site

2721. New ST Applications

Newsgroup: comp.sys.atari.st
Date: 2000-02-24 00:00:00 UTC
From: stclub@cix.compulink.co.uk
Message-ID: <894cnmhig1@plutonium.compulink.co.uk>
Source record: 65174

News of the new A4 edition of ST Applications follows - please distribute widely! The next issue is complete - just waiting for advertising copy and confirmations.

We published our first Atari magazine, The ST Club Newsletter, in the Spring of 1986 - and we're still going strong. Full of invaluable information, ST Applications is an essential read for all Atari users who want to get the best out of their Atari software.

Supported by articles from contributors to Atari Computing the new-look ST Applications ensures that Atari enthusiast will have a printed magazine during the year 2000 and beyond. Issue 78 of ST Applications will herald a return to an A4 magazine-style format with lots of new features and a regular printing schedule. Existing subscribers to ST Applications will get the new-look magazine as the next issue of their subscription.

Inside each issue:
• News - the latest Atari News from around the world.
• Reviews and Articles - new products reviewed and 'how to' articles that help you to get the best from your Atari hardware and software.
• Atari Online - our unique guide to the Atari online world.
• PD and Shareware Updates - the latest Atari software news.
• Forum - help, news, views and letters.
• Classified Adverts - buy, sell and swap hard to find Atari gear. Adverts are free to subscribers.
• Contacts - User Groups, Meetings, Shows, and appeals for help.
• Emulators and Clones - keeping your Atari software alive without any Atari hardware!

Keeping the Atari market alive:
4+ issues a year - New A4 magazine format
Free classified advertising for subscribers
Advertising and publicity for Atari suppliers worldwide
Publishing in: February, April, July, October and December 2000.
Single issue: £3.50, 4-issue subscription: £12.
(Overseas rates and distribution: please email us for latest details.)

"I first contributed articles to ST Applications way back when it was a newsletter and for years it remained my favourite Atari magazine. ST Applications has always been written by enthusiasts for enthusiasts - long before we penned that phrase to promote Atari Computing. Although ST Applications never ceased publication, in recent years it was a shadow of its former self. So I'm absolutely delighted that FaST Club have decided to re-launch ST Applications in a format which gives it a chance to

recapture those halcyon days and, more importantly, those ex-Atari Computing readers looking for something to read! For the first time in years, I'm looking forward to reading something I haven't already edited and also look forward to contributing articles to ST Applications. I wish everyone involved the very best of luck." Joe Connor, Atari Computing

Extendos (commercial) or Spin (freely distributible -- not sure
if it's free or shareware as I don't use it). As for why you'd
want to -- I use a CD player as my 4 year old's primary drive.
He can't delete anything! As for games, stick with 1.04, 2.06
is slightly LESS capable in that department.

2729. Help! Just messed up Falcon HD Driver

Newsgroup: comp.sys.atari.st
Date: 2000-02-24 00:00:00 UTC
From: Brian Hutchinson <bthutch@earthlink.net>
Message-ID: <38B4C3BB.B58875D5@earthlink.net>
Source record: 65292

I was trying to get the demo version of HD Driver to work and the Falcon quit seeing the Conner IDE. The .txt file in the demo says to boot from floppy, run hddriver.prg and then hddrutil.app and then do install.

Well, I try to do that but hddriver.prg puts up a banner about the Conner and then just hangs and the floppy drive just keeps spinning. I never get the chance to run hddrutil.app

Am I booting wrong. I've tried booting without holding any keys down, booting while holding down control, alt etc.

What am I doing wrong? How do I get my IDE drive back?

I started doing all of this because I just got a SCSI CD-ROM and I wanted to try and use it.

Thanks,

Brian

OK, wow that scared me. I rebooted a few times and was able to get the demo to run and I now have a hddriver.sys in C:\

I still can't get my CD ROM drive to do anything. Scan of the SCSI bus shows it is there but when I do install HDDriver it only lists my IDE drive.

What do I do to get the CD ROM to work? I thought HD Driver would run CD ROMS?

Thanks,

Brian

2731. SCSI CD ROM question now

Newsgroup: comp.sys.atari.st
Date: 2000-02-24 00:00:00 UTC
From: Brian Hutchinson <bthutch@earthlink.net>
Message-ID: <38B4D696.8BEB723C@earthlink.net>

I still can't get the CD ROM to do anything interesting. It is a NEC Intersect CDR-73. It has dip switches on the back for parity and arbitration. Do I need to enable parity and arbitration. I have already tried it both ways and it didn't seem to matter.

What are the settings in HD Driver that I should make. Anyone got a good setup of values they can share. Right now I only have the CD-ROM on the SCSI port. I also have two other SCSI-2 HDs.

Thanks,

Brian

2732. HD Driver and GT Look Update

Newsgroup: comp.sys.atari.st
Date: 2000-02-24 00:00:00 UTC
From: scornio@erols.com
Message-ID: <38b4a97f.8806654@news.erols.com>
Source record: 65295

Ok, here is an update of my problem. If I disable the Generic SCSI Driver under Advanced Options, GT Look sees the scanner and functions correctly. This has the undocumented and undesirable side-effect of disabling several functions within HDDRUTIL, such as being able to partition disks, but it is a simple matter to re-enable the Generic SCSI Driver when these functions are needed. I am using version 2.02 of GT Look, which apparently has its own SCSI drivers built in and doesn't support external drivers. If I use version 2.11 of GT Look which can be downloaded from the Belgian ftp site, it does see the scanner when the Generic SCSI Driver is enabled and external SCSI is selected within GT Look. Unfortunately when Pre-scan is selected, the scanner performs the pre-scan but GT Look locks up. Ctrl-C restores the program, but an error is reported (in German) and the program refuses to talk to the scanner until the computer and/or scanner is rebooted. In summary, for now I will simply turn off the Generic SCSI Driver when I want to use the scanner.

I did download and try version 7.8 of HD Driver and would be interested in purchasing it, but so far as I know, only version 7.71 is available here in the US.

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! I have 6 different Catalogs, and my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference Material for the Classic Atari 8 Bit & Atari ST! And remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, March 9th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. We're trying to rebuild our club so we're looking for Atarians who wan't to get involved in supporting other Atarians. If your interested, call Ben at (503)256-9974 and by all means, come to our meetings on the 2nd Thursday of the Month. For more info, surf the Web@

2738. Atari Today - New UK Atari Magazine - Free Advert Offer

Newsgroup: comp.sys.atari.st
Date: 2000-02-25 00:00:00 UTC
From: TechSoftware <BobF@techsoftware.demon.co.uk>
Message-ID: <895n5q$i3d$1@newsg2.svr.pol.co.uk>
Source record: 65184

Atari Today

More good news on the magazine front. Atari Today will
be launched in March. This is a new A4 style magazine
which includes articles from Atari developers, users
as well as a round up of news, reviews and general interest
articles on the Atari scene.

Each issue costs 2.50 UK Pounds and includes a cover disk.

If you are a supplier of Atari hardware or software you
can place a quarter or half page advertisement FREE in
the first issue. We have a limited amount of space and
it is let on a first come first served basis. Advertisements
must be sent as a 300 or 600 dpi GIF file. This is the
only format we accept for free advertisements.

Quarter Page is 90 x 130 mm
Half Page is 180 x 130 mm

You can also place 1 FREE classified advert in the magazine.
Send up to 50 words in ASCII text format. Again space is
limited, so first come first served!

We have a great first issue, with games reviews, programming
features, accelerator news, and more. Should be available
mid March.

Bob Frost
Editor/Atari Today

2739. fVDI v0.95 released!

Newsgroup: comp.sys.atari.st
Date: 2000-02-25 00:00:00 UTC
From: rand@cd.chalmers.se
Message-ID: <895ualkck1@nyheter.chalmers.se>
Source record: 65185

The release version of fVDI v0.95 is finally here! :-)

Lots and lots of things have obviously happened since the last real
release (v0.85) at the end of the summer of '98 (I promise the next
version won't take as long to appear ;-), but the beta archives on my
ftp site have been updated relatively often.
I won't go into detail about what's new here. You can find a list of the
most important things on my WWW pages (see .sig), if you're interested.

fVDI, for those who haven't heard about it, stands for the

Fenix/Free/Fast VDI

'Fenix' is a project initiated by Sven Karlsson, which aims to produce a
complete replacement for MiNT/BIOS/XBIOS/GEM. fVDI is the VDI component
of that and (for the time being) the only part, except for the Fenix
kernel itself, that exists.
You can read more about it at http://www.it.lth.se/~sven/Fenix/index.html
'Free', in this case, stands for freedom in the GNU sense. That is, fVDI is
placed under the GNU General Public License. In short, this means that
you are free to give a copy away to anyone you like (even if you for some
reason bought it in the first place (fVDI is currently supplied with the
Eclipse graphics card, for example)), and that you can get at the
complete sources if you want. Anything built using those sources must
then also be protected by the GPL.
For more information, visit http://www.gnu.org
'Fast' has always been an aim for fVDI, but not to such a degree that it
interferes with other design goals, such as portability and flexibility.
Still, in the cases where fVDI isn't at least comparable to NVDI
speedwise, it's mainly because I haven't got around to it. ;-)

The VDI, Virtual Device Interface, is the part of GEM that normally
handles all drawing to the screen, printers, etc. There has always been
one built into the Atari machines, but various replacements and extensions
(GDOS, FontGDOS, SpeedoGDOS, NVDI, etc) have appeared over time.
fVDI can in principle handle the same job as for example NVDI, but so far
only screen output is possible, and there's no vector font support.
You can, however, use fVDI together with another VDI to get at your
normal printer drivers, and even vector fonts if you're prepared to
sacrifice some performance.

So, what will fVDI do for you?

Even early versions were quite capable of handling all the screen output
from the programs I use daily myself. With v0.85, most programs that
didn't use 'advanced' graphics or text functions (for example circle

drawing and text effects) worked fine. Since shortly after I got my Eclipse/RageII (prototype) card more than a year ago, I've been running under fVDI all the time.

With v0.95, very few programs should have any major problems. For example, the demo versions available on the net of Kandinsky, ArtWorx and Papyrus can all display their example images/documents on my Eclipse/RageII graphics card using nothing but fVDI (it's possible to run NVDI 'on top' if you want to, like it's done with the NOVA cards). Like the original VDI, fVDI does circles, ellipses, pies, polygons and thick lines. However, it can also handle Bezier curves and areas in the same way as more modern VDIs.
The usual text effects (italic, bold, outline, underline, grey) are all in there, as are the normal placement methods (+ some of the newer ones). Some things are still missing, however, such as rounded rectangles, line markers, text scaling, and flood-fill.

Included in the v0.95 archive are drivers for monochrome, 16 colours and for the Eclipse/RageII (8/16/32 bit). The bitplane drivers have some limitations (for obvious reasons, I've been more interested in improving the RageII drivers), such as not handling line patterns, and the 16 colour driver only does text/icons/patterns in black and white.
You can bypass these limitations by turning off specific acceleration functions (that's what the device driver primitives are called), but that is usually _very_ slow.

Installation

Installation of fVDI can be very simple. Just rename two files (assuming that you're running in monochrome, otherwise you'll also have to change a '1' to a '4') and double click FVDI.PRG from the desktop. For more advanced installations, such as running from the AUTO-folder or making extra fonts available, you'll have to move a couple of files and edit FVDI.SYS (similar to the normal ASSIGN.SYS, but with more options).

All the information you need should be in the included documentation, but if there's a problem, please email.

Naturally, any and all bug/incompatibility reports, comments, etc are very welcome.
If anyone is interested in doing some work on the bitplane drivers, or perhaps on a completely new driver of some kind, please contact me.

Benchmarks

Finally, a couple of selected test results from my Falcon+AB040, running in copyback cache mode, using TOS 4.04 with WiNX (normal grow-boxes). More complete tables will be made available on my WWW pages soon.
I'd be interested in results from other machines too.

I didn't 'rig' anything to make fVDI look better, but the fact that fVDI was written with the '040 in mind will certainly skew some results (I have no idea which, or how) compared to other machines. The 'fVDI shadow'

test refers to a special mode that's only of use for machines with very fast access to non-screen RAM.

For the monochrome tests, which were run in 640x400 (SM124), fVDI was started from the desktop to make the testing easier to perform. The 256 colour test was done in 640x480x8bit mode on my Eclipse/RageII, with fVDI running from the AUTO-folder.
GEMBench percentages are relative to a normal Falcon in mono and 256 colours (standard GEMBench 4.03 comparison), respectively. I also included the actual timings to make comparisons between monochrome and RageII/8bit possible.

GEMBench ------------- Monochrome----------------- --256 colours-
------------------fVDI-----------------
NVDI 4.xx normal shadow RageII
Time %
GEM Dialog Box 0.825 424 0.985 355 0.785 445 0.990 676
VDI Text 0.195 1743 0.205 1658 0.180 1888 0.130 5730
VDI Text Effects 0.400 1872 0.360 2080 0.360 2080 0.230 6369
VDI Small Text 0.180 2083 0.090 4166 0.090 4166 0.105 5904
VDI Graphics 1.140 765 1.650 529 1.425 612 0.350 4771
GEM Window 0.545 256 0.590 237 0.535 261 0.320 1171
Blitting 0.790 141 0.735 152 0.630 177 0.160 5437/69
VDI Scroll 1.165 226 1.175 224 0.815 323 0.265 5660
Justified Text 0.895 364 0.945 344 0.960 339 0.205 4634
VDI Enquire 0.070 2257 0.080 1975 0.080 1975 0.130 1576
New Dialogs 0.890 500 1.075 413 0.920 483 1.255 681/309
(fVDI doesn't draw the monochrome lines (graphics test) in XOR mode, and outline text (text effects test) is spaced differently.
Apart from that, everything should be the same, IIRC.
In the RageII column, two entries are of the form 'value1/value2'. The first number is with my default settings (blits are cached whenever fVDI decides it's appropriate) and the second is with all such caching turned off (the blits are then done to/from normal RAM.)

VDIBench (results are in 'per second', so higher are better)
Normal Text (normal) 60201 60464 68298 100548
Small Text (normal) 86961 160658 175287 158173
Thin Lines (solid single) 3568 3396 6045 14860
(solid poly) 4121 3864 7543 72619
Polygons (solid complex) 772 606 607 28823
Beziers (simple curves) 4877 10772 10542 11624
(complex curves) 2074 3608 4464 5670
(simple areas) 1003 1348 1355 9674
(complex areas) 206 385 386 4950
Rectangles (solid) 666 751 860 6466
Circles (solid) 665 279 298 1181
(outline) 875 878 1104 1319
(Quite a few tests have been skipped here, for various reasons.
Some don't work as they should (VDIBench is not finished), some don't really say much extra, and some are rather uninteresting for most

people. Complete results will be available on my WWW pages.)

>Pro driver kicks in!

Look out for a utility called "Noroach" by Atari themselves. Apparently it
will write a bootsector to the floppy in A: which will overcome this well-
known double boot phenonomen.

I guess there wouldn't be much of a problem if one kept to a sensible cable
length - you seem to have quite a number of devices "hanging off" that bus
BTW, what are they? I guessed at the CT2 and a video card but... :-)

>photos are located at
>www1.iwvisp.com/mgrove/main.htm

Thanks for putting them there, a very elegant non-soldering solution.

>Where can I find Glue Stick for Ifusion?

Doesn't exist, see below.

>Is Ifusion the same thing as Iconnect that comes with CAB 2.7?

No. IConnect is the stack and dialer software that you need to make a
conection to your ISP (if you choose not to use STinG, the PD alternative).

IFusion is bundled with the ftp client Fiffi from V1.20, and that allows
one to use non-Iconnect clients such as NEWSie with an IConnect connection.

>OK, wow that scared me. I rebooted a few times and was able to get the
>demo
>to run and I now have a hddriver.sys in C:\

I was about to suggest that you use your original HD software to boot your IDE, and then run the program in the AUTO folder of HDDriver to install its driver, and then running the HDDriver utility to install the driver to your hard drive.

>I still can't get my CD ROM drive to do anything. Scan of the SCSI bus
>shows it is there but when I do install HDDriver it only lists my IDE
>drive.

Have you enabled the CDROM's SCSI ID in HDDriver? There's an option to do that automatically in HDDriver, plus make sure that the "Generic driver" box is ticked.

Have you actually installed a CD driver BTW? HDDriver will only make the CDROM known to the system, you then need a specific driver to have it available for use. Extendos is one example of a driver.

There is a program I am beta-testing called CDISO that appears to
recognise the long filenames. I have not tried writing it to a CD, but
when I load one in, it comes up in the long-filename form.

2758. Problem: Magic 6 with NVDI 5 on TT030

Newsgroup: comp.sys.atari.st
Date: 2000-02-25 00:00:00 UTC
From: bytor <marvinjrNOmaSPAM@mindspring.com.invalid>
Message-ID: <00005415.0632966f@usw-ex0103-024.remarq.com>
Source record: 65204

I am having a problem with my TT030. I have used NVDI 5 for a
while without problem. I have just gotten Magic6.
I reformatted my TT's HD and started with a clean drive. Next I
installed Magic6 and it worked great. I then installed a few
applications to test further, still no problem.
Now that I have installed NVDI 5, on boot-up the Magic 6 intro
screen appears. Then a message appears stating "Drive A: is not
responding:Abort, Retry, Ignore?". No matter what I do it stays
locked at this point.
Any ideas?

Thanks,
Bytor - USA

Source record: 65205

It seems I am still out from nodelist, Peter can you check my connected areas
?

BTW the question is this: Applylst does not work as it seems to be affected
by the y2k bug, so it deletes my nodediffs as it recognizes them as "obsolete
difference file".

It it possible to get the Applylst sources or is there another software that
can do this ? Breakneck ?

```

Hmmm... Don't agree.. The Nemesis and CT2 overclocks about the same things.
The CT2 has fastram and run the new CPU twice as fast.. But I agree it's a
bit tricky to install. But it's extremely stable and compatible except for
the DSP-irq thing (that can be patched with software OR hardware) I've heard
a few horror stories too. But most of time its due to fitting difficulties.
It's very sensitive if you don't fit it right...

On 24 Feb 2000 04:00:49 , Stephen Cornio wrote:

|Ok, here is an update of my problem. If I disable the Generic SCSI
|Driver under Advanced Options, GT Look sees the scanner and functions
|correctly. This has the undocumented and undesirable side-effect of
|disabling several functions within HDDRUTIL, such as being able to
|partition disks, but it is a simple matter to re-enable the Generic
|SCSI Driver when these functions are needed. I am using version 2.02
|of GT Look, which apparently has its own SCSI drivers built in and
|doesn't support external drivers. If I use version 2.11 of GT Look
|which can be downloaded from the Belgian ftp site, it does see the
|scanner when the Generic SCSI Driver is enabled and external SCSI is
|selected within GT Look. Unfortunately when Pre-scan is selected, the
|scanner performs the pre-scan but GT Look locks up. Ctrl-C restores
|the program, but an error is reported (in German) and the program
|refuses to talk to the scanner until the computer and/or scanner is
|rebooted. . . . . .

If you want to try an earlier version of Look2 let me know.

->No, it won't. But why would you use that? Your monitor sounds fine to
->me, I wish I could afford a Mag!

Hi Jo Even! He is probably wanting the most compatibility with
games and Euro-style Falcon demos. Thats why I grabbed a multi-
synch monitor from Software Hut. It will synch down to ST-Low
levels, allowing games and RGB demos to run, while still doing
SVGA up to 1024 x 768. Note that a monitor that does this is
considerably more expensive. I have a 17" Electrohome, and 2-3
years ago, it was $649.00. I'm sure they have come down in price
since then, and there is a cheaper 14" model as well...

See ya! ;-)

I've read with interest all the posts since I asked the question or
where I can get a copy of Texel 2.x. Other than a suggestion via email
from Systems for Tomorrow, I've had no answers. SFT is out of stock,
and they only had version 1.

But I have the impression there is some concern as to the accuracy of
the results of calculations in version 2.x. Is this true??

I'd still like to know where I can get a copy.

Thanks.

From: Alyre Chiasson <epinoche@nbnet.nb.ca>
Message-ID: <38B7E716.EA07F1BC@nbnet.nb.ca>
Source record: 65227

Hello,

I am trying to upgrade the floppy on a TT that was given to me. The TOS dates 1990 and the machine was equipped with a 720K floppy drive. I put in a 1.4 drive and flipped dip switch 7, nothing. I have no docs but was wondering if the WD1772 chip supports HD? I have a broken Mega Ste and was wondering if the chip C302096-001A is the HD controller chip, in which case I would swap.

Thanks

Alyre

2787. Upgrading ROMS in a 1040STf

Newsgroup: comp.sys.atari.st
Date: 2000-02-26 00:00:00 UTC
From: Glenn Bruner <brunergs@pcisys.net>
Message-ID: <38B7F8F9.328E7A2C@pcisys.net>
Source record: 65230

I'm looking to upgrade my TOS in my ST to TOS 1.04. Does anyone have
the ROM images available?

I have a copy of TOS 1.04, but it's one complete file and not separated
into individual ROM files. I don't quite
have information to split the file into 6 EPROM images. Can anyone give
some information on which chips cover
which ROM locations?

Any help would be appreciated.

Thanks,
Glenn Bruner

Alyre,

The WD1772 drive controller will not reliably support the high density floppy drive. You'll need to change it to the newer AJAX controller. I still have several of them in stock if you need one. Price is $10 with Priority Mail shipping included (continental USA only). Email back if interested.

The AJAX chip number is C302434-001/A.

Sheldon

Last Updated 02/26/2000
- Sold/Traded Items Removed

I have the following Atari 5200 items for sale or trade. All units are fully functional, cleaned and detailed, and in good or better condition. If you have any questions in regards to unit, box, or label condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please use this link to contact me jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.5200 (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari/TI 99/4A), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

This list covers the following Atari categories:
- Controllers
- Shrink-wrapped/New Games
- Multicarts
- Atari Force Comics

Controllers for Atari 5200 & Computer Units
==========
These controllers are intended to use the standard Atari plugs, and require an adapter to work on the 5200.
- 2x Suncom Tac Joysticks $10 for the pair
- 1x Spectravideo Joystick with suction cup base

** Atari 5200 Titles - New/Shrink-wrapped**
==========
- Ballblazer by Atari/Lucasfilm $20
- Pitfall by Activision $15
- Rescue on Fractalus by Atari/Lucasfilm $25
- River Raid by Activision $10
- Space Shuttle by Activision $12
- Zone Ranger by Activision $10

Multicart Cartridges
==========
- Atari 5200 Multicart $125 - Contains all of the released 5200 game titles as well as demos and the 5200 diagnostic cart. Game selection is done by using DIP switches.

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Electronic Games Magazine memorabilia Please make an offer
==========
-Order Form Insert (Vectrex Version) - Mint Condition. This was the original full color order form insert that was packaged in with many companies cartridges to help promote sales of 'Electronic Games' magazine. It is a three page foldout which covers all the regular articles that 'Electronics Games' ran. The front cover is purple and offers Vectrex players a 44% discount.

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games
- A working Vectrex controller
- A working SONY SAT-A50 Satellite Receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

2791. Atari info needed :)

Newsgroup: comp.sys.atari.st

I recall there was something about them not to long ago, but my PC went up ni smoke :((((not suppriseing really) and its taken me ages to get back online. Would have been better getting online with my Falcon cos to reinstall the OS you just press RESET, heheehhe

Anyway I'd love to get online with my Falcon, but could do with a boost, I've been looking at the core design board for a while and I'd love to buy one. I recall something about the things gone bust or something ??? are they selling the things or not ? and if not WHY NOT!!! :o)

Secondly, I want to get a new HD driver for my Falcon one which will take PC drives ? I have a 2.5" PC drive but it dont work on my current driver, which one will work and where can I get it ?

I once tried to get online with my Falcon but I think it failed on the script bit in CAB. So could any kind soul send me a script to log on to somewhere such as freeerve, taking out thier actualy logon options but telling me what to change of course :)

Is is possible to fix my Falcon up with my PC monitor ? I'm using my TV at the moment via scart, done it that way for about 10 years now with my Atari ST.

I think thats all for now :)

please be kind and mail me if you can answer anything :)

Chris

I tried the player today and it looks very promising indeed. Do it work on a normal Falcon without problems ? on my Falcon it plays (kind of) with pops and clicks and beeps and repeats itself as it goes along. If this a lack of power on the Falcon ? or should I investigate the DSP been faulty ? (removal of nemesis)

Thanks, please mail me direct :)

Chris

I can't help you but I would be interested in the same information.
I also have an early TT which has a 720k floppy - it was cheap as it
was a re-done return to Atari and I did not mind the floppy (it was
compatible with the Mega and the ST).

On 24 Feb 2000 04:00:49 , Stephen Cornio wrote:

|Ok, here is an update of my problem. If I disable the Generic SCSI
|Driver under Advanced Options, GT Look sees the scanner and functions
|correctly. This has the undocumented and undesirable side-effect of
|disabling several functions within HDDRUTIL, such as being able to
|partition disks, but it is a simple matter to re-enable the Generic
|SCSI Driver when these functions are needed. I am using version 2.02
|of GT Look, which apparently has its own SCSI drivers built in and
|doesn't support external drivers. If I use version 2.11 of GT Look
|which can be downloaded from the Belgian ftp site, it does see the
|scanner when the Generic SCSI Driver is enabled and external SCSI is
|selected within GT Look. Unfortunately when Pre-scan is selected, the
|scanner performs the pre-scan but GT Look locks up. Ctrl-C restores
|the program, but an error is reported (in German) and the program
|refuses to talk to the scanner until the computer and/or scanner is
|rebooted. . . . . .

I heard recently that there were 'incompatibilities between ExtenDOS
Gold and HDDRIVER v7.80 when "target mode SCSI" was enabled in
HDDRIVER.' Are you using ExtenDOS with HDDriver?

>I'd like to upgrade my Falcon but there are so many options I don't know
>about:
>Nemesis

Well, I've been quite happy with the Nemesis in my Falcon. It'certainly
makes the computer much nicer to use than a standard Falcon, but it's also
certainly not the fastest of the ones you mention.

I was able to find it used (here on comp.sys.atari.st from a nice guy in
Finland) for a great price, and the install was fairly cheap as well.

>I want to speed up my system, get better video (true color and 1024x768
>at least) and run various OSs like Linux, NetBSD, Minix, Mint etc. as
>well as TOS.

Well for what it's worth, I'm a MagiC user. ;^)
But with regard to the resolutions I run with Nemesis / Videlity (which is
basically the software that allows setting up all the various parameters
involved in getting the best possible resolutions out of your chosen
monitor), they are:

944 x 720 x 16 | 912 x 688 x 256 | 704 x 528 x TC

Trying to push it much beyond these numbers results in a fairly unstable
picture, especially in True Color mode. And for the record, this is on a
new Viewsonic 17" monitor (which is very nice, by the way!)

While we're on the subject of Falcon resolutions:

I use the Nemesis/Videlity combo on my Falcon, and as mentioned in a previous post, run at various higher resolutions without a problem.

But, when I try to utilize a higher resolution in 2 color mode with Cubase Audio, CAF always puts the screen back to the default [normal] size you would get in 2 color mode as soon as it loads.

Is there any way to get CAF to run in the higher resolutions made possible with the Nemesis/Videlity?

|

Have you tried another diskette in drive A while booting? My drive A diskette crashed a few minutes ago. I had been using this diskette as the boot disk since 03/24/98; it served it's purpose well :-)

I had the same error as you did earlier today. I tried reading the directory and couldn't, although the Silkboot sector could still be read on bootup until a few mintues ago.

I've been using MagiC 6.01 since December 27.1999. It has been working great along with NVDI 5.03. I'm using a TT 4/16 megs with a Nove VME Plus graphics card and a Seagate 4.55 gigabyte drive.

2811. CAB.OVL update 1.40

Newsgroup: comp.sys.atari.st
Date: 2000-02-27 00:00:00 UTC
From: baldrick@dilbert.netset.com
Message-ID: <38b8d974$1_1@athena.netset.com>
Source record: 65107

```
New CAB.OVL full package now available.

http://www.netset.com/~baldrick/

What's new?

Many small changes.
PUT implemented. (http method for upload *NOT* supported by all servers)
POST variant of PUT (used by egroups)
An alert on Authentication informing you of the realm you are
authorizing to use. Sometimes contains information you need
for authorization.(Hi freemans ;)

Why the big version jump?

Well I thought PUT was worth a few minor version numbers.

Have fun and enjoy,

Dan Ackerman
aka baldrick
```

2813. Re: WD1772 controller chip, HD or DD?

Newsgroup: comp.sys.atari.st
Date: 2000-02-27 00:00:00 UTC
From: vdjole@EUnet.yu
Message-ID: <89bvje$5ck$1@SOLAIR2.EUnet.yu>
Source record: 65109

On 27 Feb 2000 13:47:26 , Jim DeClercq wrote:

>Well, the original WD1772 was tested at 8 MHz. Some of them would do
>16 MHz, but were not tested for that. The WD1772-02, howeever marked,
>does the 16 MHz necessary for a HD drive.

As far as I know, the suffixes on WD1772 refer, in fact, to the temperature range that the chip is certified for. Thus, WD1772-02-02 has a wider temperature range than WD1772-00-00, and can better withstand heating caused by overclocking.

I dont know the details of TT schematics- does it use the WD1772 chip in the same way as ST/Mega? i.e. switches its clock from 8 to 16MHz for HD floppies?

It is well known that a ST or a MegaST one has to install a small electronic circuit to do this switching. All the variants of this that I have seen are made so that the chip is fed by 16MHz MOST OF THE TIME- except when there is a DD floppy inserted. The overheating problem is thus understandable.

But this small circuit can be made so that it switches the WD1772 to 16MHz ONLY when the floppy is working (i.e. its motor is spinning) AND a HD floppy is inserted. In this way the chip is subjected to 16MHz only for brief intervals when the floppy is actually used, and the overheating would be much less. I suspect that a WD1772 even with a lower temperature rating might do the job then- but I didn't try that.

I have installed a circuit with this additional capability in my MegaST (a little board with a single 74LS151 chip, sitting piggyback on the WD1772). Admittedly, this is WD1772-02-02, but anyway, it has been working for a couple of years now with HD floppies, without a single problem.

>The AJAX chip does exactly
>same thing as the WD1772-02, and costs a lot more.

Are they exactly the same? I seem to remember that AJAX has an additional register or two, concerning switching the steprate (or is this register in the DMA chip... my memory is failing me...)

>ST.

Yes, I'm using a standard SVGA multisync (Sony Multiscan 15sf) but you
need a Falcon to VGA lead, available from all Atari suppliers I should
think.

Note that you then won't be able to use the Falcon in RGB mode - it
automatically switches to VGA. This means you can't get a decent True
Colour resolution, however allows you higher resolutions with 256
colours (600x400 and further with software and/or hardware
enhancements) and high non-flicker refresh rates. The system appers
to run slower in VGA mode as compared with RGB, presumably because of
the higher scanning frequency.

The Microvitec 1438 is a rare breed in that it's a SVGA multisync that
is capable of scanning down to RGB frequencies. So you could get a
video lead with a switch on it to switch between RGB and VGA and use
the same monitor.

Well, I've not used the bigger ones, but I use to have a 45meger on my Falcon030.
On your TT, if it's a SCSI one, you could get a two device cable and hook it into your internatal hard drive, or you could use the Atari hard drive port if you had a icd host card, OR the SCSI port. If it's like the 45 meg drive, they have a device number button on the rear of it. But you should be able to figure out something.

P.S. Your post is the ONLY one I've seen in any newsgroup today, I think someones news server is down.

> Infact I have CAB working
> better on many Webpages than Others using NETSCAPE 4.5.

Not surprising! I use that at work (it's our standard browser) and it
has so many bugs when dealing with CSS it's not funny (particularly when
developing a new web site, as I'm doing at the moment). Combine CSS and
tables and the thing is worse still :-((

As many sites use CSS now (with good reason), Netscape does all sorts of
horrific things on them unless the authors have managed to work around
its worst excesses. CAB cheerfully ignores CSS so unless the site uses
the wilder end of CSS (eg positioning etc) the site should still be
usable. Which is part of the reason for CSS in the first place (ie older
browsers ignore the styling but the content is intact).

> Also what is the serial/modem port limit on the 286? Is this the same
limit
> as the ST without hardware mod. at 19200?

IIRC from Demon's FAQ about this, older PCs without an upgraded serial
port may be limited to 9600 for reliable TCP/IP as the older serial
chips have buffer problems.

They're usually paid-for and not that quick on my P200, I've found. I thought there might be a version of the OS for comparable-architecture machines. For example, by way of comparison, the Sinclair QL OS, QDOS (and its descendents) are available for ST and Amiga.

There must be something out there. I will take a good look in my
collection. Something else you might like:
On my homepage you can download MEX2MID. This is a little tool I
created to convert standard SysEx files (.mex, .syx, and others) into
standard midi files. Then you can use midi sequencer software to send
the SysEx to your synth. The URL to download is:
http://www.telebyte.nl/~mt/mex2mid.zip

I know that there are ways of hooking up SCSI devices to the DMA
port on an ST. I've seen a cable being sold from Best
Electronics to hook a SCSI hard drive up. The problem is that
it's $75. Are there instructions on how to build one of these
cables yourself? Also, is there a certain type of SCSI drive
that I should try to obtain. I don't know much about how SCSI
works because I've never owned any SCSI devices. I remember
seeing a hardware mod page somewhere on the internet a little
while back, but I can't seem to find it anymore.

I just wanted to add this here as I read one German article about
this that misunderstood my statement. There is a variation on POST (the
method that is used for submitting forms and 'mailto') which handles
sending files to a website. Basically it's just a way to have a page give
the user some place to select to upload a file.

>crashed. Anyone having more succes out there?

Well it's working fine for me or else I would not have sent it out
;) What happens if you hit a site that require authentication? I'm
curious if it will cause the same problems for you. If so I think I know
where the problem is then.

Now a question for everyone.

CAB does not really support a method for reporting the progress of
a sent file. However if you are sending a big file with PUT, you really
want to know how the progress is progressing. I thought I would use the
Receive counter for this. While you are sending and not receiving, it
would at least give you some feedback on the transfer.

Does this sound like a good idea? Or do you think it would be too
confusing?

Hi

I have the following for Sale

Atari STE 4megs complete with 1 gig SCSI Hard Drive 200meg SCSI Hard Drive
SCSI CD ROM Housed in PC AT Case
Software included, Papyrus & Atari Works installed, alsoMulti-Tasking
software and Internet software preinstalled.
Philips Stereo Colour Monitor & Atari Mono Monitor with Monitor Switch Box.
Hand Scanner plus software. over 1000 disks in Disk Boxes with Utilities and
Games.
3 Large Boxes of boxed software to include utilities and Games.
Software too numerous to mention titles, it would take a long time to
download the list of all the titles of the software that is to go with the
hardware.

If fairly local to Bradford I could deliver, otherwise buyer wil have to pay
P&P which won't be cheap as there is a lot of equipment & software.

300ukp for all the lot. may split.

Atari ST high res mono mode (640x400) is compatable with
most VGA monitors. I think the scan rates are something like
71 Hz H, 35 kHz V. If you have a monitor capable of these
rates it should work ok with your Mega ST. You just need an
adaptor so that the monitor lead can fit the socket on the
ST.

Abingdon Sythesis Projects (email chrisc@zetnet.co.uk)
sell such an adaptor for 15 ukp. I think FaST Club (email
stclub@cix.co.uk) also sell them.

Ahem... Remove all the screws from the square holes. The round hole screws
hold the floppy drive. There might be a round sticker which is hiding a
screw, which would explain why the cover doesn't come off. Lift the case
off, starting on the left (cartridge port) side, and wiggle it until it
comes off of the floppy side.

Rather obvious once you've done it actually!

|
| OK - how? :-)

Remove all the screws from the squared holes (one is under the seal). Remove
the cover backside first, like opening a book. Then remove the steel inner casing.
You may want to loosen the screws from the diskdrive a bit to give it enough clearing
for removal.

Your burner software does not cover that?
Mine can burn the low bytes or the high bytes

You can also burn them in to 32 pin 1 MB Eproms and convert them afterwards to
28 pin 1MB (P)ROM pinning.

on the eprom:
bend away pin24, connect to pin 16.
On a 32 pin socket with precision turned pins:
connect pin 2 to pin 24.
connect pins 1,32,31,30.
remove pin ends 1,32,31,30.

I had that with it myself, it turns out it didn't like my TOS 1.62 from my STE, I had to dig out a STFM with TOS 1.4 for it to work.

><Looks embarrassed>
>
>I, er, can't find how to get its lid off.

Turn it upside-down, remove the nine (I think) screws at the corners and centres of each side of the pizzabox and in the centre of it (maybe covered by a sticker!)- distinguish them from the three screws holding the floppy-drive in place- it will be obvious from their position which ones are they.

In the aft left corner there is a little lid with a place for two batteries below. Remove the batteries and, by the way, check contacts for corrosion from battery leaks. Then lift the aft part of the pizzabox cover. You will notice a piece of cable from the battery housing going to a connector on the metal shield inside. Pull the cable from the connector, and then lift the box cover a little more and try to disengage it from the floppy-drive mask in front.

Once you have removed the plastic cover, it's time to remove the metal shield. The connector for battery cable has two "winglets" on opposite sides. Press them closer to the connector and push the connector through its hole inside the shield. Then, with a pair of pliers straighten the little bits of metal all around the box perimeter that hold the metal shield together with the bottom part. Once these bits are straightened so that they can pass through slots in the shield- the shield can be lifted and removed. The board is then open to view.

By the way, if you can't get the box open, how can you be sure that it doesn't have a Blitter? I think that practically all Megas, except the VERY early ones, had it.

On the other hand, if it indeed doesn't have a blitter, a question may be raised of a little piggyback board that some versions of Mega have on the CPU- this board was required for some versions of blitter, but if it is present and the blitter is not, I am not sure that everything will work properly.

Beside re-seating the chips, remove and re-seat all the connectors (power supply, floppy-drive supply, floppy drive data...).
It might be a good thing to check whether the power supply still gives 5V and 12V. You can measure it on a spare connector on the main board, near-to and identical to power-supply connector.

BEWARE OF HIGH VOLTAGE on the power supply!

>The trouble is, adding more RAM, a old IDE hard disk, and making it able
>to drive a VGA monitor ('cos I have several free ones) will cost pushing
>10X what the computer did. /That/ is a pain.

Mega 2 has empty places for more RAM chips, so it is quite a simple matter
to solder another 2MB in- though it seems that the chips required have
become quite expensive lately. Check the RAM chips already on the board
(beneath the floppy drive) for the type and speed required.

Driving a VGA monitor in ST-high monochrome mode is quite simple- it is
just a matter of an appropriate connector and (I think) three resistors in it.

Hi

I machine code program can be called from STOS and also used on the PC with would be great.

What I need to pack is just text files, and the occasional 4 bit pic. Reason is that myself and a few others are writing a disczine "MEGA disczine" not only do we want to compress files for the ST to get as much as we can on the disc (using atomic) but I plan to write a dosc displayer basic one) so ppl can view the files on the PC, or under emulator. That the intent anways.

You can download issuse form my site, issue 4 is not uploaded yet and we are now working on issue 5.

Just curious...

- What is the maximum throughput of the Falcon SCSI port?
- Any change or increase in SCSI speed with accelerators (like there is with IDE)?
- Are pretty much all "modern" SCSI drives compatible with the Falcon (Ultra, Ultra 2, Wide etc. - providing an adaptor is used)?

-Paul

From: everything55uper <everything55uper@netscapeonline.co.uk>
Message-ID: <38B9DB77.EE8CD152@netscapeonline.co.uk>
Source record: 65077

This is a Steinberg question.

I used to use Pro24 on the ST and moved over to Cubase on the ST and nowadays use VST on the PC.

My question is this, does anyone know of a file convertor from the old .sng file to a .mid file please? If not I'm gonna have to spend the next decade working via Midi between me ol' faithful and a PC which I know not a sausage about!!!

If as I'm sure it does, one exists, is there a place to download the prog from?

Thanks for any replies in advance.

> Electronics to hook a SCSI hard drive up. The problem is that
> it's $75. Are there instructions on how to build one of these
> cables yourself?

No there isn't really, because it's not just a cable. It's a special
interface with a few specifically programmed chips. It is feasible to do one
if you have experience and hardware for programming PAL firmware.

75 USD is pretty cheap actually. They used to be a lot more expensive. There
are several models around, so if you buy one, make sure it handles parity.

There are also IDE interface boards available, but they cost a bit more.

No. SCSI are more expensive because they do not depend upon
(nor benefit from) the CPU.

>- Are pretty much all "modern" SCSI drives compatible with the
>Falcon (Ultra, Ultra 2, Wide etc. - providing an adaptor is
>used)?
>
There is one form of SCSI that uses a different termination
system incompatible with the others. Unfortunately, I can't
recall it's name. Wide->Narrow adapters of course exist, and
I've used various SCSI1 & SCSI2 drives without problem. I do
not know about Ultra or other forms.

[snip]

Common direction is near impossible. Any platform you look at
has several paths, some are quite radical, some not.

And instantly this and this is utter crap... your responce already
reflects what most of the threads would probably look like
in such a newsgroup. If any has logs from this group, we surely
know already the opinions are quite deverse. ;-)

Not very helpful as you haven't mentioned which stack you're trying to use
(STinG or IConnect). Freeserve works perfectly with an Atari, once an
account has been opened.

Only ASH sell later versions of Texel AFAIK, the latest version is 2.20 for
which there is no English translation.

>But I have the impression there is some concern as to the accuracy of
>the results of calculations in version 2.x. Is this true??

The translation of 2.00 has been checked and passed by independent math
teachers, however due to the likely use a spreadsheet is likely to get, we,
DDP Translations, have included a disclaimer in the unlikely event of
things going pear-shaped.

>I'd still like to know where I can get a copy.

Second hand or try ASH and ask us to translate it! :-)

Message-ID: <memo.20000228013822.928A@lproven.compulink.co.uk>
Source record: 65127

I hardly like to ask, but I'm going to anyway...

I recently bought an ST as part of my researches into GEM for the FreeGEM project (http://www.deltasoft.com.) However, as far as I can tell it is a dead one. I don't have the right monitor for it, but it appears to give a line of bombs at power-on.

It's only a 2MB MegaST, no blitter or hard disk or anything. So the UKP20 wasn't too much of a waste.

But, I do have a reasonably-specced Amiga. 68030, 10MB RAM, 400MB HD, and a SCSI interface.

So: Are there any good ST/TT emulators for the Amiga? Preferably free?

I would buy this system in a heartbeat if it didn't have to be shipped
across the ocean. It has everything I want for my TT:-(.

However, I don't know how you can offer Tibet into the deal. Besides I am
not really interested in collecting countries with my Ataris. ;-).

14 megs, win 98 is constantly accessing the hard drive with 32 megs. When I access a menu with explorer and outlook running, the harddrive starts spinning. Even my laptop with 64 megs does the same thing. Then there is the disapearing memory trick that windows does.

I do not understand why I need 32 megs of memory to surf the web and write an email. I could only dream of having a 333mhz falcon with 32 or 64 mb of ram a 20 gig hd and all the modern softare.

With all the advances in computer technology, it's amazing that the enduser really does not get a significant increase in useability. Almost daily I bring both PC's to the point of having to reboot which in itself is a pain in the ass.

There's no such thing as a PC drive. There are IDE or SCSI drives. Both
should work. What driver are you using? Did you partition the drive? What
size? Don't format it.

> I once tried to get online with my Falcon but I think it failed on the

With STinG, you should only need to change the ID settings in the Dialer.
There are instructions in the Quick FAQ.

Of course, a Falcon is best with a VGA monitor. You just need the right
adapter or cable. Check out the Quick FAQ.

>get a hold of it?

It was called Ambermoon. Although previewed in several ST magazines it was never taken past the preliminary stages for the ST. However it was written for the Amiga. Only ever released in Germany (in German text). However a translation was done by Thalion and never released until re-discovered in 1998.

You can read about it and download it at the Thalion webshrine

> the ICD formatts?

If it's actually an ICD specific format you should re-partition your
hard disk with the Atari compatible format. This format is recognized by
any hard disk driver, including ICDs.
It's not a good idea using a proprietary format.

These is also a better (but w/o GUI) ZIP (un)packer, LHARC (sources
available), ARJ and (if you ask me !) UnRAR. Then you should use the
suitable STOS function to run external programs, supplying the correct
parameters.

> If you have any idea on how to write a compressing and decompressing code

I am quite sure that the data sheet for both the 1772 and the 1772-02 only
specifies a maximum of 10MHz - and yes, some work at 16MHz, some don't.

If you want reliable HD operation, get an AJAX.

>a
>line of bombs at power-on.

Well it is not dead yet. It powers on and gives you the line of bombs. I have alot of STs that do this after sitting for a time. Even the Megas can be suspect to loose chips. I would remove the case and physically press down on the chips on the PCB. Its safer than the 4 inch drop. I don't believe you have a real problem at hand, however sometimes the chips, I believe it is the glue chip barfs. It only takes a little time to take the cover off and do this.

I think you will be fine. Press down all the chips on the PCB even ones that are soldered in.

>
>It's only a 2MB MegaST, no blitter or hard disk or anything. So the
>UKP20
>wasn't too much of a waste.

Nope, not bad deal at all. I didn't realize that the U.K. got Mega 2 STs without blitters as well. These were the early megaST2 and supposedly the blitters were to be installed at a later date after being sold to the consumer.

>
>But, I do have a reasonably-specced Amiga. 68030, 10MB RAM, 400MB HD,
>and
>a SCSI interface.
>
>So: Are there any good ST/TT emulators for the Amiga? Preferably free?

I have heard of ST emulators on Amiga. I don't know how good. PC and Mac ones are very good. Regardless you should be able to get yours up and running without anykind soldering skill and chip replacement.

If you aren't patient, and don't want to take apart the Mega, Just give it the 4 inch drop. This can reseat the chips or unseat them more.
I believe persistance will pay off as I haven't been unable to resurrect one yet that gives a line of bombs on start up. And I have at least 5 STs with this characteristic, although my 2 Megas have been fine in this regard.

Later Brian.

<Looks embarrassed>

I, er, can't find how to get its lid off.

> £20 GBP isn't bad at all for a Mega ST2.. If you've given up on it, I
> can take it off your hands:)

I know! That's why I bought it!

The trouble is, adding more RAM, a old IDE hard disk, and making it able to drive a VGA monitor ('cos I have several free ones) will cost pushing 10X what the computer did. /That/ is a pain.

Thanks for the replies folks. Yes I've kept my ST but that is what I'm not looking forward to. That is linking them together. A bit of a B@#l Ache. But if VST will accept .sng files saved on 31/2 then that's another story.

I'm outta here to try it now!!

Thanks a lot.

Gary

Derryck Croker <derryck@NOSPAMcix.co.uk> writes:
> I tried 1024*768 on my CT2'd Falcon, but the refresh frequency dropped
> so low that the flicker became annoying

Did you use interlace? If not, do so, this will double the refresh
frequency for solid areas and only cause flickering for some patterns.
In general, for frequencies below ~60 Hz, using interlace results in a
far more stable picture. Of course, the monitor must be able to handle
high vertical frequencies, e.g. 120 Hz if you enable interlace when
you're currently running 60 Hz non-interlaced.

Ciao

| February 29, 2000
|
| For immediate release:
|
| CAPITOLA, CA -- Scatologic Inc. is pleased to announce
|that the long awaited BattleSphere(tm) for the Atari Jaguar platform
|will soon ship, and that all |profits from the game will be donated
|to diabetes research.

We still have a month to go till April 1st, so I guess we can rule
out the April Fool's day gag. :)
(I think I said a while back on a Newton list serve to never
release a product on April 1st... if you are serious.) (grin)

| BattleSphere(tm) is the awesome full 3D networked
|action shooter for the Atari Jaguar. The game was developed by
|renowned Jaguar, NUON, PSX2 and PC developer 4Play, which recently
|merged with Scatologic Inc. to form the newest industry powerhouse
|development team.

Any chance we will see this on the NUON ?

| The highly anticipated BattleSphere(tm) combines the
|fast-action gameplay of a first person shooter with the nonlinear
|aspects of a strategic campaign simulator. Also included on the same
|cartridge are several additional play variations which range from a
|pure classic arcade action game to a multi-player networked
|deathmatch mode, where up to 32 players can dogfight for control of
|the Universe. The game garnered acclaim from players when it was
|demonstrated at the World Of Atari show in 1998, and it has received
|glowing praise from industry leading publications like Next
|Generation Magazine and Diehard Gamefan magazine.

Can we say "Star Raiders"? :) Can't think of any other platform I
would rather play a Star Raiders style game on this side of an Atari
400. (grin)
Now we just need to get this style game for the Lynx and 7800 and
we'll have it covered. Panther is optional. :)

| BattleSphere(tm) was completed several years ago, but
|the release has been pending for some time due to the fact that the
|Jaguar ceased to be a mainstream platform, and the software, tooling,
|and procedures required to produce cartridges were lost and had to be
|recreated. "The biggest hurdle was overcoming the loss of the
|software encryption keyxi,." said Scatologic COO, Douglas Engel, who
|was one of the original BattleSphere(tm) development team. Scott
|LeGrand, Scatologic CEO, was enthusiastic about the team's effort to
|recreate the missing encryption key. He commented, "Generating a
|unique key ourselves allowed us to produce the highest quality game,
|cartridge, and packaging without resorting to risky unproven and
|expensive hardware bypassing techniques."

Songbird seems to be doing well with bypassing as shown with
Protector, but hey, breaking the code was a much cleaner way of going
about it. Good to know it can be done.

| In an unprecedented move, Scatologic has announced that
|all profits from the sale of BattleSphere(tm) will be donated to
|diabetes research. Scatologic CTO Stephanie Wukovitz stated,
|"Videogames are stereotyped as a harmful influence on society, and we
|wanted to show that they can be a very positive factor.

That is nice and all, but ALL profits?!?

| Donating the profits to diabetes research is our way of
|showing this, as well as a way to thank everyone who has helped us
|get this game produced."

That is nice and all, but ALL profits?!? :)

Common! I would hope there would be a little incentive to program
other games. Just my opinion of course, otherwise, highly noble of
you.

| A special autographed copy of BattleSphere(tm) is up
|for auction on eBay right now. As an added incentive, the high
|bidder's name will be digitally encoded into this very special
|collector's item.

(Smile) Well, I guess there was some room in that "packed"
cartridge of Battlesphere afteral.

| BattleSphere(tm) will begin full-scale shipping soon
|afterwards. BattleSphere(tm) is priced at only $74.99 plus $5.00ï¿½
|shipping and handling (Continental U.S.). Orders outside the
|continental U.S.ï¿½ will require additional charges depending on the
|destination. California residents must add 8.25% sales tax.

About the going rate for new Jaguar games these days.

| Copyright (c) 2000 Scatologic Inc. All rights reserved.
|This article may be reprinted in its entirety. BattleSphere(tm) is
|copyright and trademark 4Play/Scatologic. All rights reserved.

Imagine having Battlesphere otherwise surnamed
"Star Raiders 2000" out by 2000? What a concept. Being a fan of
cockpit style games, I know I'm going to be spending many hours on
BattleSphere and Skyhammer.

Probably good, since I've solved Wolfenstein and just about
finished off Bubsy and Kasumi Ninja. ;)

Thanks to all who have responded to my request.

It looks like my need for a new spreadsheet may become a reality. If so, I'll contact ASH and get the latest. I'll figure out what the German means and then deal with it. <G>

Thanks again.

> My question is, how can I include the Atari in this? Is there a way to
> bridge the Atari onto the ethernet LAN?

Yep, there is a way... but you won't have the fast ethernet speed. You
can connect your ST to an ethernet network. You need a parallel ethernet
adaptor with a RTL8012 etherner controller inside (KEY systems provide
such ones), a special device (you have to make it) to connect the
adaptor to your ROM-port of your Atari and STinG with the drivers of
Vasillis.
Elmar Hilgart made the special device on a nice little PCB, but there
are some problems with at the moment and we're still testing it out.

> It would be a shame to leave the Atari out of the game. Any suggestions
> would be appreciated.

Other, and less expensive suggestions, are also available : using a
serial nulmodem cable to the 486 and using STinG.

I suggest you take a look at these pages for more info :

> MiNT and Magic and even N.Aes have been updated regularly.
> Are you living under a rock somewhere? ;-)

No one needs to. It's no secret that there is no common direction in AES evolution. Otherwise, we would not run into this Magic or MiNT -only programs that create compatibility issues.

One easy example: Wdialog. Everyone agrees it is crap, nobody wants it shoved down their throat, yet noone has suggested any sensible way to get around it that Behne brothers might support.

Result: one cannot access the Printer.CPX that comes with NVDI anymore, unless they use Wdialog. Ndialog (with N.AES 2.0) is a joke that isn't compatible with applications that want Wdialog, half of the time.

Solution: integrate proper Wdialog functions into N.AES sources, like it was done for Magic. Problem: rumour has it that Behne don't want to hand over their API to Woller.

A newsgroup where such issues would be discussed and _resolved_ in the open, for the common good of the TOS platform, instead of keeping Magic and MiNT+N.AES development separate, would help.

Yep. Talked to them; very helpful.

However, that lead is 75% of the cost of the computer and infinitely more than a VGA monitor costs! ;)

I see no reason why.

Same family CPU, loads more RAM, and a graphics chipset that can easily
emulate the ST's fairly basic graphics.

I'm only interested in TOS & GEM, I don't expect 100% games capability.

Ah. The previous owner said he thought the lid came off with a concealed catch, but he couldn't remember where.

> By the way, if you can't get the box open, how can you be sure that it
> doesn't have a Blitter?

I was told this by the seller.

Also, I now see that at the read near the cartridge port (right hand side towards the back - is that it?) there's an empty square socket.

I can also tell it's TOS 1.41 UK from the ROM chip labels! :)

> raised of a little piggyback board that some versions of Mega have on
> the CPU

Nope.

> Beside re-seating the chips, remove and re-seat all the connectors

> in it.

I'll, er, pass on the component-level stuff.

All my PCs are home-made, and I make PCs for friends too. I service and support computers for a living.

I'm still not about to take a soldering iron to one, though!

Many thanks for a splendidly helpful and informative reply.

A couple of questions while I'm here :)

There'a a large IDE edge connector just by the CPU socket. 64-way if I counted correctly. Nothing in it. What's that for?

Also, there's an unused rows of pins (about 24 or 26) near the <?> DMA or hard-disk port.

Ah. The monitor wouldn't sync well enough for me to tell. It's an old PC CGA one.

However, I've found it works - mostly - with the Amiga, so maybe it's a cabling problem or something. I'll try again now, and report back.

Thanks!

<Guesses> Do you mean LVD SCSI? Low Voltage Differential.

It's not just termination: cabling and signalling systems are different
too. It allows longer cable runs in high-speed SCSI buses.

Paul Mac - make sure that your standard printer is set to be device #21. Works looks for that number when it tries to access the GDOS drivers. I had similar problems when I upgraded to NVDI 5 also. FWIW - setting the device driver number from within NVDI did not do the trick. I had to manually change the number using a text editor (NVDI.INF) file on the boot partition to "DEFAULT_PRINTER = 21".

Let me know if you have any problems

2mb/sec is what the spec is, a little slower IRL. As long as you have
a decent DMA buffer, SCSI still works with faster bus speeds, but that
does not increase the transfer rate.

Uwe should pickup here and have the info on the newer drive types.

You can do mono hi-res (640x400) through a VGA if you build (or get someone
else to build) a special VGA cable. There are instructions in the Quick FAQ.

I'l no programmer, but you would still be using lots of CPU cycles
translating the routines.

Well, you've just discovered the expandability of the Mega ST. The STE is
slightly more expandable because it uses SIMM memory.

Mario Becroft makes an appropriate cable. He must have someon selling them
in the UK. Look for his site in the Quick FAQ.

It's not an IDE connector. It's the MegaBUS, which is basically a direct
processor bus. There were not many boards made for it, maybe a graphics card
or two.

A CGA won't work. You want either a standard RGB monitor (or a SCART TV) for
colour resolutions (low and mid res) or an Atari monochrome (or a VGA with
the correct cable) for monochrome hi-res.

```
Yes, Cubase VST should be able to handle them.

In the worse case, use the old ST to convert them to .mid (you didn't get
rid of the ST without converting your files first, DID YOU?).

You can also "play" them over MIDI, recording with external sync on the PC.

I tried 1024*768 on my CT2'd Falcon, but the refresh frequency dropped so low that the flicker became annoying (perhaps I need to do some more fiddling). There was also some rather unpleasant Moire patterning on the desktop background. I've therefore standardised on 800*608 for all but the TC mode.

>new Viewsonic 17" monitor (which is very nice, by the way!)

I was taken by the Iiyama Pro 410, gets rave reviews.

No.

> - Are pretty much all "modern" SCSI drives compatible with the Falcon
> (Ultra, Ultra 2, Wide etc. - providing an adaptor is used)?

Yes, they are compatible, provided you have the correct adapter for wide
types. Narrow (8 bit) SCSI devices can be connected without any adapter.

I guess you mean differential. For the Falcon single ended SCSI instead
of differential is required.

>when I load one in, it comes up in the long-filename form.
We are not really waiting on a program that recognises long file names. SPIN
takes care of this since ages. A CD Writer program that could actually burn
CD`s with long file names would be a gift from heaven... :-)

Please check out the docs or history file, and put us out of our misery...

Cheers from Belgium
Dennis

>where I can get a copy of Texel 2.x. Other than a suggestion via email
>from Systems for Tomorrow, I've had no answers. SFT is out of stock,
>and they only had version 1.
Texel 2.2 German version can be bought straight from ASH, all German Atari dealers, and some dealers in Holland. If you can locate version 2.0 then you can transform it in a English version using the D&D translation. ATM DD&P has no serious plans to translate version 2.2, due to lack of coorporation from the author.

>But I have the impression there is some concern as to the accuracy of
>the results of calculations in version 2.x. Is this true??
NO, version 2.2 is about a year old now, if there would have been serious bugs a bugfix would have been released rather quickly. I'm not saying that Texel is bugfree, a bugfree program doesn't exist. Even M$ doesn't guarantee that Exell is bugfree. AFAIK there are no complaints about Texel not being accurate in it's calculations. This is just a silly rumour... don't believe it.

>I'd still like to know where I can get a copy.
Like I said, you'll have to locate version 2.0, why don't you put a small add in one of the German newsgroups... or put it in the buy&sell section of some of the German Atari websites:
http://www.atari-world.de and http://www.atari-computer.de have the biggest and probably most visited add sections.

Something like : "Hilfe ! ich suche Texel 2.0" and your email address should do it.

Cheers from Belgium
Dennis

I also used to use pro24 V2 and cubase V1 on ST. I think one way is,
with the ST, to load under cubase a pro24 file (open->24 song) and
export it as a midifile. It's probably not the best way...

Any current SCSI drive can transfer data faster than the Falcon can
accept them. The SCSI specification provides for data transfer rates far
beyond 2 MB/s. Usually it's the Falcon that limits the transfer rate,
not the drive, except for very old drives.

Do not underestimate the power of MMU chips, Nick :) ! Most of the differences (from a programmer's point of view) lie in the different memory maps. AFAIK and as already said, Amiga video chips are much more flexible than ST/TT ones (compare the latter with the corresponding 1200 AGA chipset IIRC).

2940. Want Seagate SCSI Hard Drive

Message-ID: <38BC1120.64143E7B@ziplink.net>
Source record: 65034

Hello. I have a 520ST that I have recently started playing with again.

I am also setting up a small ethernet LAN so my Sun Sparc2 and 486 (both running Linux) can talk to each other as well as my Macs. I plan on getting a cable modem or DSL in the near future, so that all of these can share a fast internet connection.

My question is, how can I include the Atari in this? Is there a way to bridge the Atari onto the ethernet LAN?

It would be a shame to leave the Atari out of the game. Any suggestions would be appreciated.

Thanks!

-Chris

I certainly like mine a lot.
For some performance numbers, take a look at my recent fVDI announcement
on this newsgroup.

>- you'll never get it. Try finding a Nova instead.

I know that at least two ordinary customers have got their Eclipse's,
but the general distribution still seems to be held up for some reason.
Cortex was in limbo most of the autumn due to illness in the family,
but last I heard (end of December, IIRC) that was about to change.

At least one batch of the cards have been produced, but there was some
extra work that needed to be done on each one by David himself, IIRC.
Bringing the company up again might be taking too much of his time right
now, but that's just speculation.

>> Afterburner 040
>
>I have one myself, so naturally I'd recommend it ;-) However, it's been

I really like mine.

>and it has been extremely stable and reliable. Haven't had one single

My first one died due to a cracked socket (!), but apart from that it's
been working like a charm.

>problem with it, except that I had to change my Nemesis-setup quite a
>bit to get the DMA working properly. Haven't touched the hardware for

I modifed my clock-patch while installing the AB040, and SCSI has been
unreliable ever since...

>atleast two years now, and this Falcon has been used a *lot*. It's
>probably been used for atleast 4-5000 hours since I got it.

Mine has also been in heavy use, and it works perfectly with the
Eclipse. ;-)

>However, the Afterburner is a lot more compatible that most people
>think, I have been using it for the last 2 1/2 years and have never

Definitely.

>bothered installing that AB/030-switch. I can't really recall having
>had any problems, but then I don't play games on my Falcon.

The majority of the handful of games I've tried have actually worked on
my AB040, but lots certainly wouldn't.

>> The monitor I am using is a Mag 17". I think I might have a problem
>> here too. I don't think this monitor will do ST low will it? Monitor
>
>No, it won't. But why would you use that? Your monitor sounds fine to

It's been a while, but aren't the ST colour modes double-scanned (each
line drawn twice) on the Falcon? I certainly seem to recall using those
modes just fine on my 30-68 kHz monitor.

>me, I wish I could afford a Mag!

My 15" Mag died two or three weeks ago. :-(
I've had it since it cost more than most 19" monitors do now, though,
so I guess I shouldn't complain.

Hi,

I have a freeserve account which I suse now on my PC, I was using STing, as STick would not work at all. Sting would dial and I would here a second or 2 of modem nosie then nothing, no matter what I did for the setup for the script. I was beginning to wonder if my modem was at fault not the program :(

>just a little thing, how do you make magic 6 boot up in a colour? all
>i get is a rather depressing grey.

Yes, I have Magic 6.01 on my Falcon, and since the bootup image
displayed is actually a 256-color image, it would be nice to boot up
in a 256-color mode instead of ST-High black and white. Changing the
NVRAM graphics mode setting doesn't change anything. Magic seems to
be hard coded to boot in ST-High. Is there any way to change this
(i.e. setting some variable in the MAGX.INF file)? It's more or less
just an aesthetic thing, but I'd love to see a beautifully colored
welcoming screen! Any ideas?

I'm experimenting with a demo version of this but I'm coming up with
some rather strange results in the file selector window e.g.

CSAST folder Window on the desktop - 49 files
Everest - 0 files in directory
Editress - 5 files " "
Luna - 0 files " "
Tempus - 5 files " "

Other folders in the same directory are OK but change to another set of
folders and a partition and it happens again. I've run Optimiser and
that's not showing any problems and I've Optimised partitions.

Has anybody else had this problem?

Hey,

I've got a megafile 44 that I would like to add a
second SCSI drive to. I'm trying to use it with a stock 1040stf...It
worked at one time, but I've changed the dip
switches on the bottom around trying out some hard drives.

Now I can't remember where the switches were to begain with!

There are 3 switches:

on EAM
[] [] []
1 2 3

Could someone please give me some pointers?

Can I add an old 80meg SCSI mac drive?

Can I swap the syquest for a SCSI CD-ROM?

Thanks,

Dale (linux-guy)

Use a null-modem cable to one of the Linux boxes. Note, however,
that 500KB is rather thight. You might be able to use a terminal
software (e.g. ConNect) or even start a TCP/IP stack (e.g. STiNG
or MiNT-Net), but definitely won't have much space left for apps.

IMHO, your ST should at least have the maximum 4 MB of ram, if
you wanna use it for anything serious. Even better would be to
upgrade it to TOS 2.06 also.

I would like to check with the newsgroup first that it is ok to place an advert on this group for Atari St related equipment & software I have to sell.

Please either reply to the group where I will read or reply to my email.

I apologise if I may have offended the group or any individual.

Here is a question I would have for one such newsgroup:

Would it possible to extend (improve?) the way AES accesses the menu
bar routines, so that they no longer block the rest of the environment?
How would this affect the older applications; is it possible to
accomplish this by some AUTO utility... and so on.

Of course it is okay. Anything related to the 16-bit Ataris or
their clones is fine here.

The only thing NOT okay are things related to other platforms.
There is a separate newsgroup (comp.sys.atari.advocacy) for that.

No accelerators or IDEinterfaces? :)

Sorry. I meant to say IDC - insulation-displacement connector - not IDE -
integrated drive electronics.

But I type IDE a lot more than IDC!

2980. FS: Atari ST Software

Newsgroup: comp.sys.atari.st
Date: 2000-03-01 00:00:00 UTC
From: Niaz Khan <gospvg@hotmail.com>
Message-ID: <89jdv0$2gff7$1@fu-berlin.de>
Source record: 64973

I have to sell the following Atari ST software

M1 Tank Platoon
Ultimate Virus Killer v6.3
Sim City Terrain Editor
Uninvited
Quartet 4 channel Sequencer
Lotus 3 Ultimate Challenge
LDW Power Spreadsheet
Atari Archive - Hard Drive back up program (UNOPENED)
Atari First Basic (UNOPENED)
Atari Hyper paint
Atari Intro to Sound & Music - Music Maker Plus & Sample Master including
Cartridge.
Atari Hyperdraw
Atari Fastcom2 - Modem software (Unopened)
Rave - Midi Music Recording Studio
Superbase - Database Package
Stereo Master - Sound sampler including cartridge
Rolling Ronny
Atari Intro to Basic - Power Basic
Atari Intro to Utilities - Includes: Wercs - Gem Resource file edit, Fontkit
Plus 2, Knife St - Disk editor & more

Please make me an offer for an individual title or for the whole complete
set, I am based in the UK & would ideally like to sell to the UK so please
bear in mind postage cost.

I will over time be selling other Atari ST related software & hardware I
have to sell, But a basic list is an Atari STE 1040, Atari STFM 512, 2
monitors, keyboard, mixer, Approx £1500 worth of software e.t.c, so watch
this space.

Maybe it is then. I'm not familiar with CGA monitors, and have never heard
of people using them. What you do have to check is its ability to sync to
the ST frequencies described in the Quick FAQ, and that all the correct pins
are there. You need H-sync, V-sync, Red, Green and Blue, and Ground.

Next, you'll need to build a cable with the correct Atari DIN socket, which
is rather tricky, but not impossible, to find.

Incidentally, this cable is nearly the same as the VGA cable described in
the FAQ.

It shouldn't be worth more that 10 UKP. Then again, you should be able to
find an old SM124 for 30 pounds which should give you a nicer picture.

Not that I know of. There was also a SCSI board available once.

There are IDE interfaces available that connect directly to the processor,
so they should be adaptable to the MegaBus too.

Thanks to everyone who replied. I always thought the Falcon's SCSI port was faster than that. Interesting...

I've never had any real compatibility troubles with any of the SCSI drives and peripherals I've used on my Falcon (of course they've all been either SCSI I or SCSI II - nothing beyond that).

I was asking mainly because I was considering adding a new drive, and these days pretty much all that is available is ULTRA, ULTRA WIDE, ULTRA 2 etc.

And also, I recently acquired an older Pentium 100 PC (it was being thrown out by someone in my apartment complex!). Anyway, it works fine, and I was going to add a SCSI card to allow using some of my Falcon's peripherals (especially my extra SyQuest drive to allow easy transfer of data between my Falcon and the PC), and wasn't sure if the lower end Adaptec card would be good enough. But it has a throughput rate of something like 10MB/second, so now I see my worries about it not being fast enough [in comparison to the Falcon] were unfounded.

2986. Falcon Keyboard Trouble?

Newsgroup: comp.sys.atari.st
Date: 2000-03-01 00:00:00 UTC
From: Nurmix@socal.SPAM
Message-ID: <89jom211se5@enews1.newsguy.com>
Source record: 64979

I'm a bit puzzled by this one:

The last couple of days, the <quote> key on my Falcon's keyboard [" ']
only works _every other time_ the key is pressed" (like at the end of that
sentence, I had to hit it twice to get the closed quote).

What's the deal? Seems if the contact for that key was going bad,
it's performance (or lack thereof) would be more random.

There's no way your going to get a 512K ST onto that Ethernet, and be able
to use it. There's a little topo with some links about networking in the
Quick FAQ. You could connect it via a serial connection, but the question is
what for? With only 512K, you'd hardly have enough room to run anything
useful.

I tried to check out the quickfaq, but it appeared to be down. Is it mirrored anywhere?

Also, I have the 1 MB upgrade for this machine. I was hoping I could at least do a little text-based terminal stuff, or basic file transfer. Some of the other replies suggest that this may be doable, even if it is a little silly. But hey, I do a lot of silly stuff. After I work on the Atari, I'm going to revive a Mac SE.

Yes, that would be the blitter- but on the LEFT back side, looking from the front (that's where the cartridge port is). I don't think you will miss it much, they say that blitter has been outperformed by NVDI software anyway.

>I can also tell it's TOS 1.41 UK from the ROM chip labels! :)

Nice. It is one of the beter ones. You could have ended with TOS 1.2...
In my country there is (was) also a problem that most Atari machines are (were) from Germany, so when I bought my Mega I had to perform a weird three-way transaction to immediately change the German TOS ROMs and keyboard and make a UK machine. But, as soon as possible, you should try it with TOS 2.06, at least disk-based (ROMs can not be directly substituted as TOS2.06 is larger and at different addresses). There is a BIG difference.

By the way, you are in the US, aren't you? Is the keyboard on that Mega a "UK" or "US" one? the US keyboard should have one key less (and a larger left shift key)- maybe not quite compatible with "UK" ROMs?

>> It might be a good thing to check whether the power supply still gives

>> near-to
>> and identical to power-supply connector.
>
>How? I don't have things like a volt meter hanging around!

Well, you can borrow one or get a friend to measure it for you. The reason I mentioned it is that I found that, after several years of use, my Mega lost almost 0.2V on 5V supply to the mainboard, bringing it dangerously close to lower limit for TTLs- and this was due to high contact resistance on the power supply connector on the mainboard as the oxydation accumulated during the years. Some months later I observed the same thing on the floppy-drive power supply connector (the floppy started misbehaving intermittently).

>> Mega 2 has empty places for more RAM chips, so it is quite a simple
>> matter

>> to solder another 2MB in
>
><Falls off chair>
>
>/Soldering in/ *bare chips/ is "quite a simple matter"? Ye gods!

Ahm, a positive attitude towards hardware hacking seems to be a
prerequisite for an Atari user :) To be serious, soldering in RAM
chips requires some patience, a calm hand and a little experience with
the soldering iron, but it is a fairly straightforward job. If you don't
have the hand for soldering, maybe "with a little help of your friends"...
and it would result in a nice and tidy-looking board expanded to a
maximum 4MB. Oh yes, a little capacitor should be soldered alongside
each RAM chip, and there are three small resistors :)

>> Driving a VGA monitor in ST-high monochrome mode is quite simple- it is
>> just a matter of an appropriate connector and (I think) three resistors
>> in it.
>
>I'll, er, pass on the component-level stuff.

You shoud look anyway in the FAQ, it is only soldering several wires
to a connector. Finding this weird conector (cheaply) might be the hardest
part of the job. I think you can even omit the resistors; you wont get
the correct white colour on the monitor but something bluish instead.

>A couple of questions while I'm here
>
>There'a a large IDE edge connector just by the CPU socket. 64-way if I
>counted correctly. Nothing in it. What's that for?

It is the MEGABUS expansion port. Almost exactly like the complete CPU bus,
and the same pinout, except that there is not +5V on this connector
and I think a couple of bus arbitration signals are not directly from
the CPU bus, but buffered instead.

Not many expansions were made for this, as far as I know. A couple of
graphic cards, FPU cards, etc. Theoretically a ROM upgrade (i.e. for
TOS2.06) might be made to fit in, or an Alt-RAM expansion, an IDE hard-disk
interface, or some special gadget. Generally, anything that is memory-mapped
might be made to fit in it. I think that today it would be mostly on a
do-it-yourself basis, unfortunately. I plugged a FPU board in there.

>Also, there's an unused rows of pins (about 24 or 26) near the <?> DMA or
>hard-disk port.

It is the same DMA (ACSI) hard disk port for hard disks installed (with
host adaptors) inside Mega's case. Makes a nice, tidy configuration-
but one has to take care to use HD with modest current consumption.
Pinout on this connector is different from that on the 19-pin D-connector.

>Are you living under a rock somewhere? ;-)

MiNT and N.Aes are, in fact, patches grown to dinosaur size. They are nice, but overgrown and based on not very sound roots, still needing the ROM-based TOS but eating more and more memory over that with each new upgrade. MiNT, with its Unix-likeness is somewhat of a foreign body in TOS heritage which has always been closer to CP/M and MS-DOS (I DON'T say that they are better than Unix- to the contrary). Magic is on a way of its own, not always compatible and not always liked by users.

I think there is ground for discussion on what a more modern TOS-compatible system migh look like. With some luck, a consensus of users' wishes might be reached. Then maybe even someone might code it. It might be an approach similar to the one that I have read once about: creating a new application software should begin by writing a user-manual in detail. Then, when one knows exactly what one wants, a clean code design may be made.

nameerf@flash.net (Michael and Nicole Freeman) writes:
> it would be nice to boot up in a 256-color mode instead of ST-High
> black and white

Unfortunately, there's no way (that doesn't involve patching) to make
MagiC boot in anything other than ST-High on Falcons hooked to a VGA
monitor. NV-RAM video settings aren't evaluated at all by MagiC.

Ciao

>If you use the menu option Change resolution to create a resolution and hit
>save then it will be stored in magic.inf, as #_DEV 5 ????

This works when you finally get to the desktop, but what I'm asking
about is during the boot process, when AUTO programs are being loaded
and Magic displays it's boot image. Changing the MAGX.INF file makes
no difference at all. Neither does changing the NVRAM settings. I
know a lot of people would rather see the scrolling text and so
disable the image, but I like the simple aesthetics of it, so I'd
rather have a nice image to look at while AUTO programs are loading.
It would be even better if it were in color rather than ST-High.

That was to form part of the "further tweaking may be necessary" bit :-)

As you say, setting Interlace on certainly helps, however I still find the
flickering unpleasant (I must be sensitive to such). The best answer may be
to fit a graphics card, but realistically I'll probably stay with my
current settings.

>2 of modem nosie then nothing, no matter what I did for the setup for the
>script. I was beginning to wonder if my modem was at fault not the
>program

Well STinG works perfectly with Freeserve as demonstrated by others -
speculation, is your modem set to return connect codes as numerics rather
than verbose text? IIRC the command is ATV. Unless STinG gets the
appropriate return it will no doubt hang.

Other things to check:

HSModem's components installed in the right order
Sting.prg follows immediately after
Only serial.cpx and sting.cpx in your CPX folder, both active

If the fast ram is set-up the same as on a TT, Afterburner or Mighty Sonic, you can use the old FAFAXX.PRG to load fast ram (replace XX with the amount of ram installed and run from autofolder before applicatons that you want to run from alternate ram). If it is like the Speed Resolution Card, then it sets-up fast ram to a different address and that application won't work. Make sure you run NVDI as soon as possible after you install the alternate ram. FAFAXX.PRG installs an FRB buffer, but if the app you find doesn't do that, be sure to enable that option in HD Driver.
I have FAFAXX.PRG if you want to try it, no harm if it does not work. Wish I could help you out more.

Yep,- I know, but the problem is that I have a kind of special phoneline, a special Internet-line, and I only have to dial 0 to get online. Now, this line have no dialtone and I can`t seems to find the command that tells the modem not to wait for the dialtone.
The results is that the modem disconnect before I get online.

The old init string that I use with the X-Link modem won`t work.

I use:

AT&FX1\T90

the AT&F to get the factory setting, the X1 to turn off the dialtone and the \T90 as a inactivity timer. If I don`t use this with the X-Link, I loose the connection.

cheers

>with 'init string'? I see that you are using Magic so then i guess
>you're using Iconnect, I'm using my modem with Sting without any probs.
>

Hi Jï¿½rgen.
No,- the box says 3Com U.S.Robotics 56K* Message Modem, V.90 compatibel.

Yes,- I use Iconnect with grat success, by "init string" I refering to
the commands that start up the modem, the problem is that I have a kind
of special phoneline, a special Internet-line, and I only have to dial 0
to get online.

Now, this line have no dialtone and I can`t seems to find the command
that tells the modem not to wait for the dialtone.
The results is that the modem disconnect before I get online because the
modem don`t get a dialtone.

And the old init string that I use with the X-Link modem won`t work.

I normaly use:

AT&FX1\T90

the AT&F to get the factory setting, the X1 to turn off the wait for
dialtone and the \T90 as a inactivity timer. If I don`t use this with the
X-Link, I loose the conection.

First of all, let's start with one drive only. Disconnect the
other. Try using the software, and, if possible, try to feel
the drive for vibration. I suspect that the drive is looking
for a command that isn't being sent (probably a jumper
problem). If no combination of jumpers works, try SCSI.PRG (on
the the 6.5.5 disk) and try sending DRIVE ON as a command.

>Also it would seem that this ICD software will only allow me to
>partition to 35 meg max.
You can go far larger as a BGM partition.

Hey, you're doing better than I did last night. Took a used
Compaq 1.06GB, formatted it, copied all my data to it, switched
the hard cases, and the drive gets recognized before 2-4 bombs!
Something is very wrong with my C: partition as all the other
partitions work fine (once I boot off of floppy). Sigh.

Seriously, it sounds like a jumper setting. You should try
various settings. In a pinch, run SCSI.PRG and send the drive
direct commands to see if it responds. Your drives may be bad
(perhaps mine is), but I'm pretty sure it's a stray jumper.

Source record: 64854

OK, so here's what I'm thinking:

If the Atari can support basic TCP/IP apps like telnet and FTP, then maybe I can connect it to either the Sun or the PC via serial line. From there it will have access through the ethernet LAN and cable modem router out to the internet.

At this point, I'm trying to learn how to do this on the Linux side of things. It doesn't look too hard. However, I am really new to the Atari side of things. I've had the machine for over 12 years, but it's been in storage for the last several years. Before that, I used it for basic word processing and DTP.

So, am I crazy to be even trying this? The machine is a 520ST with 1MB RAM and an external floppy and HD. I was hoping to get network access for the purpose of pulling down software directly to the Atari.

Am I way outta line here, or should this all work?

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, March 9th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get together with other Atarians. Make friends, meet new people, maybe find an old friend. Eat Pizza, drink Pop or Beer in a decorative atmosphere. Bring your family to a family friendly place. For more info try:

http://pac.pdxweb.net

e-mail: atari@benjamin.net

>>>Can anyone advise if issue 16 has been posted to subscribers ?.
>>Got mine in California sometime in January.
>>
>>Galen
>
>I thought that Atari Computing had quit Publishing last fall? Did they
>continue to fullfill their obligation to subscribers?

Atari Computing did indeed quit publishing. Every subscriber should have received issue 16 by now, plus a refund for any unexpired subscription outstanding.

There seems to be good news on the horizon with two magazines about to arrive - STApplications being one that will delight those like me who remember it when it was first launched all those years ago. Anyone interested should email stclub@cix.co.uk to register support and maybe pledge a subscription.

And there's Atari Today, announced in this newsgroup a few days ago, the contact here is Bob at BobF@techsoftware.demon.co.uk

There was also a petition started by the German magazine ST Computer to have it translated into English, but that seems to have been withdrawn, unfortunately.

>prerequisite for an Atari user :) To be serious, soldering in RAM
>chips requires some patience, a calm hand and a little experience with
>the soldering iron, but it is a fairly straightforward job. If you don't

I'd say that the hardest part of this job (harking back a number of years!)

was actually clearing the solder holes for the extra chips. I managed to
lift one of the tracks and had to patch it with a wire.

There are alternative methods to upgrade memory involving a SIMM, which
might prove less complex - the hardware hacks page at
http://www.freeweb.org/computer/vezz/atari/hardware/ will surely help.

Go to http://www.cyberstrider.org and follow the Petr Stehlik link - you'll
want to download PARCP, which utility will do exactly what you want, and
with no need for extra cabling for handshakes. It uses a standard cable
with two wires reversed at one end - clear instructions are in the archive.

The only "oddities" that I'm aware of are the various messages that are scattered about in the ROM, and the characters in the character set which make up the picture of a man's face with a pipe when they are typed side by side.

I had to look at the calendar to make sure that it isn't April 1st, but this character is very real, he even has a name - Bob.

Have a look at my y2k page (address in signature below). You'll find an extensive description of the problem (possibly more extensive than you'd want :-)), links to patches, and information on programs with known problems together with workarounds, solutions and available upgrades.

They certainly did. The one good thing about AC closing was the way they managed to do it cleanly, without owing money (to the best of their ability). Subscribers got all the issues up to the last and were offered their money back on any remaining subscription period or goods in kind (eg CDs, other software).

It's all to do with a text buffer in CAB which is too small to accomodate possible topline texts. The whole caboodle gets corrupted. I'm not sure but I think that CAB 2.7 cures this.

3023. For sale or trade: Atari Portfolia PC card driver, and other stuff

Newsgroup: comp.sys.atari.st
Date: 2000-03-02 00:00:00 UTC
From: Kasper <kasper@industree.org>
Message-ID: <89pdsg$400$1@odysseus.uci.kun.nl>
Source record: 64866

I was given an Atari Portfolio PC card driver, a PC card (ISA) with cable and device, to write and read the 128 kB memory cards that belong to the portfolio. It's in a box, and the card and the device are still packed in plastic, so it was never opened or used before.

I don't know what I can do with it myself, so I want to sell or trade it for a MIDI expander for my TT, or something else that I find useful (musical toys, PC-stuff, etc.).

Other things I want to sell or trade are several STFM's, an STF and an STE, many SM124's and one SM125.

If you are interested, let me know... The ST's are gathering dust, so I don't have to get a lot of money for them. I live in the Netherlands by the way, so shipping might be a problem...

greetz,
Kasper

Do not overestimate this approach. It is perfectly possible to describe in a book
a program that can not be run in a computer.

Source record: 64903

hello, dear Atari fans!

I just got a grip on MagicPC and remember these neat old Atari APPs like Script, Twist, XAct and the like. When changen to a PC, I already used some Tool called Ghostlink (if I remember right) in order to transfer my text and graphic files.

I remember that this connection was thru the serial ports, and due to the ST's upper limits quite slow as well.

Now, I wounder if anybody has written yet a data link tool, which uses the parallele (printer) port? I know that it is out only with the atari, hence one will need a feed back thru the serial port in order to send poll commands, check sums and verification codes.

The major data stream was from ST to PC, then. Any knowledge about possibly existing implementations of this?

bye and good luck

rUdi

Hello Falcon-knowledgable dudes.
My question is this, if one was thinking about getting a
Centurbo II board fitted and also re-casing a Falcon, would there
be a problem getting the Centurbo put in first and only afterwards
recasing the Falcon? In other words are there problems recasing a Falcon
<after> a centurbo has been fitted?
I guess I'm wondering about moving everything over.
Any advice is appreciated.
Mark

Profits are pretty loosely defined. Profits often time refer to:
Programmers time and money
Manufacturer's time and money
Investors money etc.
Whatever left over get donated. It sounds somewhat lame but really people
have to eat.

I think it's a good idea and I hope it does make profit :)

If you let CT2 install by Rodolphe you have to send him the naked
motherboard. So when you get it back you can put it in its new
casing and have it there with the least possible effort.

Hello everybody !

I had read some years ago, that there is an easter-egg in the first
version of the TOS.

It seems to be the picture of the "fathers" of the Atari ST.

I have downloaded TOS 1.0 to TOS 2.06 (US Only), in order to find the
pictures. I had also download the latest (???) version of WinSTon...

Did anybody know how to do ?

Thanks a lot !

This is a theoretical throughput rate if your PC is quite old. Your PC
and your drives must be quite new in order to reach this.

I can only assume that this was done to make things easier for the programmers as opposed to getting it to run in the saved screen resolution. However I am courious as I an thinking of getting Magic for my Falcon and ST, I have read that you can run MagiC on an normal ST, to do this it must surly be capable of booting up in some colour resolution, or can you only run MagiC in ST in high?.

d> There are 3 switches:
d> Could someone please give me some pointers?
d> Can I add an old 80meg SCSI mac drive?
d> Can I swap the syquest for a SCSI CD-ROM?

Yes I know you can add a second SCSI unit moving a switch, it is the first
one, number one.
The scsi cdrom should also work, installing a cdrom driver.
The other two switches select the device number of the first drive, from 0 to
3. The second drive device number is always 1+ the first.
Both drives must be set like device 0.

Be careful about total power needed by devices.

Moving house and I can't really justify taking this with me :-(

Atari 1040STFM - internal floppy, memory upgraded to 4Mb (TOS 1.2 I think)
crystal clear SM124 monitor
2nd external floppy disk drive
matching grey mouse mat :-)
clock cartridge
SCART lead for connection to TV (+ aerial lead for prehistoric TVs)
Kempston joystick - solid steel and nylon, arcade leaf switches,
will withstand any punishment
Quickshot Maverick joystick - rapid fire, broad base, suction feet,
switchable to support several different
game systems (Sega Nintendo Amiga ST etc)
Original manuals + UK language disk
HiSoft GenST assembler + monitor
Pile of games + other software

Can probably deliver in Edinburgh area. The monitor's lost its box so
courier/post delivery might be out.

Excellent retro gaming platform (my daughter's going to miss playing
Barbarian :-)

£100 ?

>
>Galen
>

Ok, I did that Galen.. but .....

I was able to get the ADSCSI interface to detect both drives.

They are HP D2075A drives 535megs each.

I am using ICDs HD BOOT 6.5.5.

Detected... but I cant seem to use them at all.. if I try and format
etc.. I get timeout errors..

Not sure where to go from here..

Also what is the max size partition I can build? is there any other
driver software I can use that will allow me to make bigger partitions
than just 33 meg???????

Thanks

James

OS-9 is a multi-tasking, multi-user operating system developed by Microware for computers using the Motorola 6809 and 68000 cpu's. I've used it on a Radio Shack/Tandy Color Computer and also own the Atari version.

I would love to see an OS-9 based personal computer running at 500 mhz in a windowing environment. It would runs circles around any Windows based computer.

Source record: 64921

Well can anyone give me a hand with an STE with 4meg Rainbow TOS with duel Floppy and trying to work with an ICD FAST case with an ADscsi interface (original type I think) and two HP D2075A 535meg scsi drives

I have the drives 1- closest to the adaptor - not terminated. Parity disabled and Delay spin up disabled.
2 - furthest from the adaptor - terminated with resistor packs all other settings same as above.

ICD 6.5.5. HD boot.. I can get both drives detected.. ID 0 ID 1 and ID 6 is the ICD System Clock.

But when I try and format or partition I get drive time out errors.. It will get into the format program.. but it takes forever for things to work.. and then dies from a timeout error.

Also it would seem that this ICD software will only allow me to partition to 35 meg max... is there something that I can at least get up to 100???

He didnt mean MACOS 9 :-) I think.
There is a real time operating system called OS 9.
It was called so for almost 2 decades I suppose and there must have been a port to ST once.

Somebody must have been naive or arrogant to call a os OS. :-)

There is some confusion here as to "booting up" and actually "running" what is being talked about is the process where you see what auto folder prgs/app are being loaded. Magic 6 can hide all this with a picture {splash screen} for the few seconds it happens and for troubleshooting save this info to a file, this picture is 256 colours but because of the way Ataris work it is only displayed in b&w, it is probably displayed in colour on Magic PC 6 but I don't have that version yet. It's like asking why can't the text at bootup be green ? for instance. Once Magic "runs" and reads it's inf file it will work in any rez/colour you have set and your machine is capable of. It will work without it but NVDI is a real boost if it wasn't for Magic I would have ditched my Ataris long ago. I use two falcons at home with it, and have an almost identical set-up on a laptop PC via Magic PC

Exactly.

>file, this picture is 256 colours but because of the way Ataris work
it is
>only displayed in b&w, it is probably displayed in colour on Magic PC 6 but

Well, if it would use the NVRAM or have a MAGX.INF setting for
changing to a higher color, this wouldn't be the case. It's not how
Atari's work, but how Magic works that's causing this.

>I don't have that version yet. It's like asking why can't the text
at bootup
>be green ? for instance. Once Magic "runs" and reads it's inf file it will
>work in any rez/colour you have set and your machine is capable of. It will

Magic reads its MAGX.INF file *before* it loads the "splash image"
otherwise turning the boot image on or off in the MAGX.INF file would
make no difference. Therefore, for future versions, why not place a
MAGX.INF command into Magic that not only displays the picture, but
changes to what ever color mode the user wants? I've always been a
big fan of giving the user as much control over the way things look,
feel, and work as possible (which is why I've always loved Atari's).
Like I said, this isn't a big deal. It's just an aesthetic thing more
than a real operational issue. I'd just like to see that feature
available. I know that it is possible. They just haven't done it.

>work without it but NVDI is a real boost if it wasn't for Magic I
would have
>ditched my Ataris long ago. I use two falcons at home with it, and have an
>almost identical set-up on a laptop PC via Magic PC

Magic is ok. It's not the end all and be all of Atari operating
systems, though. For some things, I like Magic, mainly because of its
speed and appearance. But for other things, Geneva+Mint has been the
best way to go, as there are some features of Geneva that Magic
hasn't even touched yet. And vice versa, of course. I'd actually love
to see an OS that is a combination of the best features of both. But
that's just dreaming, I guess... :)

It still is called OS-9.

There were two ports to the ST I believe. One was done by Reccoware Systems in Germany (rebadged and sold in the UK by Cumana). The other was done by Microware, the company who created OS-9 (although this could also be a rebadged version of someone else's port - I just recall seeing it in their price list a long time ago).

> > Somebody must have been naive or arrogant to call a os OS. :-)

But they didn't, they called it OS-9 (which originally stood for "operating system for 6809" - it got ported to the 68000 and other processors later).

> There was indeed, and there even used to be an OS9 website related to

If a NG could be created for AES then this would be great. The discussion would be for known reasons and not an argument like we see in this NG about the future of the Atari OS.

I am all for it. Because those going to use such an NG would have an open mind to future ideas and revisions. Doesn't mean there won't be the heated discussions we have seen here, but possibly more productive discussions, than we have seen here.

However a couple things come to mind.

1) Who would participate?
2) Would it be very active?
3) Can open discussion actually make a difference for the future of Multi-
tasking OS?

I am all for it, as long as everyone realises that Geneva is the best;-).

Later Brian.

Opps, using Magic atm;-).

Someone came along with:

Mega ST with extra
Magnum ST card
Made in germany by Heidel Sofwtare service.
There is tos 2.06 on it and a 72-pin memory module

I do think I need a program for the Auto-folder to get that extra
memory as TT-mem.

Anyone knows where to find this or how it is called.?

Met vriendelijke groet,
Ronald van der Kamp

>Niall

IIRC this is an NVDI problem. I believe it has been fixed. Somehere
should have the answer to this, regarding a patch.

However, using a 1meg ST and floppy with CAB 1.5 with STing, and NVDI
becomes a moot point as there is not enough memory to do anything.

So using CAB 1.5 and Sting, you have to rely on system fonts which aren't
pretty when the text gets large.

Hi Chris!

Well the answer at the moment is no, unless you investigate StiNG's
networking ability under TCP/IP.

However, Ethernet capability is on it's way, courtesy of Mario Becroft,
which apparently should work on all Ataris, (assuming you have a proper
cartridge port).

Cheers!

James

Well, it is surprising to me. I had no idea. I have never used it Netscape 4.5 but was only trying help others by testing sites, and saying that if it works on my 15 year old ST, it should work with yours, and also things to the effect that the website is up/active and not down.

>As many sites use CSS now (with good reason), Netscape does all sorts of

>browsers ignore the styling but the content is intact).
>

I know I have been told before by Q-funk what CSS was, but sure enough I have forgotten again:-). I am just happy that CAB works in this regard.

Yup, this appears to be the case. THanks for the information.

Now, I would like to address another issue with regard to Web Browsers on the Atari.

Using CAB and an Atari ST is truly a blessing. I am totally happy with the combination, based on my expectations of what an ST web browser should be capable of. It is very hard to complain that you have a Web Browser that is very stable working on a 15 year old computer. Infact I look at all Internet/multi media applications and consider each piece of software for the ST to be a bonus far and above what I had purchased the computer for in 1985. It is very difficult to complain. Therefore it makes enjoying an ST and its software that much more. Everyone uses the web for different purposes and I have been extremely lucky, because for each need that I have on the Web, my ST has proven capable. Therefore you are probably aware that I don't do my banking etc via the internet. Perhaps if I wanted to I may be disapointed because my ST can't do it via CABs lack of support for SSL and Java. (It is SSL isn't it?) But I don't think it would be an issue, more than a wish, or feature. However, I choose not to use the internet for banking. That is all. So I haven't encountered these problems. As things are, there seems to be enough information on websites to keep my little Atari Busy.

Of course the next step would be owning a Falcon/TT/Hades/Medusa or modified 030 hack and up. These computers are capable of doing the forementioned needs that users are claiming needs to be implemented in a "Modern" Web Browser. Clearly knowing that the machine is capable and the software lacking, would lead to one saying "BUT WHY NOT", why aren't these developments implemented. Clearly this is the line of Q-funks basis for abandoning the 68000 computer for more modern needs. And the fact is an ST can't perform the functions needed, (Although I would like to see someone try to implement it for the sake of a challenge, regardless of speed and useability), but in the end, I must agree with his logic, even though I don't like him and prefer him living in Finland vs Canada. However, even Falcons/TT/ and perhaps Hades were around before the large demand to implement Java on Websites became the more dominate focus of WebDesign. Only recently has it really become an issue with users here. (The Stability of CAB has not been). However, one could argue that although capable, these computers and their software before such features became the norm so that it is not surprising that there isn't the proper support in CAB. Thus the need for a rewrite, as some claim is needed. (As long as it works like the CAB I know and enjoy, I am all for a rewrite).

Which brings us to present day. I use an ST/TT and Falcon, in various different configurations. I use CAB with these computers. I have no complaints with CAB other than I would like for it to be improved to take advantage of what my TT/Falcon are capable of but as things are, I accept that CAB has less features/capabilities than what is available on anyother platform.

However, my attitude would change 180degrees if I were to purchase a NEW MILAN II, (Which I intend to do). We know what is required of a modern Web Browser. We know that the Milan is capable of providing the necessary Horsepower to use such features. We know that the internet is the primary function of many household computers today. We know what is available on other platforms on significantly faster machines.

If I OWN an Milan II, I want a modern Web Browser that will perform the functions needed today. Without that I can settle for a Falcon, TT or even an ST to run CAB. Other than colours and speed there really is no difference. I don't simply need a faster version of CAB, I need a better version if I am going to buy a Milan.

Finally off the CAB topic. I have been playing with WenSuit on my ST and TT and All I can say is. This program is very very very fast. Works good on a ST. Has quirky displays at times and doesn't load all web pages properly that I have tried. But if one wants a faster browser for their ST and can put up with using the program, this is the one to use. Assuming that the PPP connection works, as I haven't used this program online. I am curious to know what this program would behave like if it was a finished product (Like CAB) vs a work in progress which is what it appears to be.

I don't know anything about Draconis, and apparently I am better off because of it:-). So no comment.

So there you have it. I am content with the current version of CAB. Would like to see it upgraded but even today can live with the fact that it is behind the times. I find it a solid performer. However, If I had a NEW COMPUTER (MILAN) and it came with a Web Browser, I would also join the ranks of the disenchanted, if it could not support the modern needs of todays internet users.

Brian.

Not certain how big Lichtenstein is, but I don't believe I can fit in my Living room. I already have to many Ataris using up the space. Wait a minute, This would mean I could use Lichtenstein to put my Ataris in. I should have plenty or room. Yup, for certain, and smaller and more economical than Tibet.

Anyways, it doesn't look as I will be purchasing the system, (Distance and everything makes it not worth it), but if I did get the system and Tibet, I would give Tibet away for Free.

Source record: 64799

Hi to all you ATARI folks,

Excuse the intrusion into your news group for a little help.

A musician friend of mine has had an ATARI 520ST (Upgraded 4Meg) since
the 80's. He does not know much about computers, and has no desire to
change machine or Software.

He has been using C-Lab Notator V3.1 [(c) 1988], SN:- 1744409 for ALL
his
music needs. The problem is the master disk has now failed, and he
NEVER made a Backup in all this time. He is now DESPERATE to get
back into business, as this machine and Software is his source of
livelihood.

(12 Years of Continuous use for this 3.5" floppy, not bad going !!)

He lives in Cape Town South Africa, if someone in the area has an old
C-Lab Notator programme they wish to sell, he will pick it up
'yesterday' :).
I guess he only needs to buy the disk, as he still has the cartridge
which
works. But if they work as a pair, he'll buy the set.

Any help, hints, tips, web sites, restore software would be appreciated.

Best Regards,

Tim Cameron

3079. Re: Hooking up SCSI hard drive to 1040st

Newsgroup: comp.sys.atari.st
Date: 2000-03-03 00:00:00 UTC
From: Tom Rosso <audiophiliaNOauSPAM@yahoo.com.invalid>
Message-ID: <1fecafe4.2e99b7c8@usw-ex0102-084.remarq.com>
Source record: 64804

I've looked at thrift shops before, but they normally have
little more than a few Pac Man and Asteroids carts for the
2600. I'm thinking about ordering one of the new upgraded hard
drives that Best Electronics sells. I guess they take an old
shoebox drive with a dead hard drive, replace it with a SCSI
drive and the hardware to plug it into the DMA port. Does
anybody have any experience with these? Are they worth it?
And, do they include hddriver with it?

Hi Michael,

>>this picture is 256 colours but because of the way Ataris work it is
>>only displayed in b&w, it is probably displayed in colour on Magic PC 6 but
>
>Well, if it would use the NVRAM or have a MAGX.INF setting for changing to a
>higher color, this wouldn't be the case. It's not how Atari's work, but how
>Magic works that's causing this.
Yes, but then there would have to be a seperate MagiC Falcon version...

MagiC replaces the complete OS unlike MinT and Geneva. In fact one could throw out his TOS based ROM's and replace them with ROM's on which MagiC is burned. When an ST, Mega, STE or MegaSTE boots the resolution is recognised by the type of monitor which is attached. With an SM124 attached the computer will boot in ST High, with anything else attached it will boot in ST Low. The default is ST High, just like with normal TOS.
Since the Falcon and TT have no way to recognise what type of monitor is connected they are booted standard in ST High. There's absolutely no way to change this, otherwise people with ST's would risk their color monitor or TV.

So, what it comes down to is that when using a Falcon or TT one is stuck with the monochrome boot up screen with a maximum size of 600x400.
MagiCMac, MagiCPC and MagicMilan boot in VGA 256 colors, because on these machines it's not necessary to check the connected monitor.

Cheers from Belgium
Dennis

Ok I have not done that yet.. I have the specs on the drive.. with the
jumpers that are available.

I did have these drives on a Adaptec Controller in a PC system and
they were working fine.. so I know they work.. Just cant seem to get
them working here.

>>Also it would seem that this ICD software will only allow me to
>>partition to 35 meg max.

>Galen
>

Ok how do I create BGM partitions? is that an option? is there better
software available that will work better than 6.5.5?? or will this do
the trick .. just not working at the moment.

If when you say "software" you mean "games", then it won't work. Most games expect to run from the floppy. Other than that, the only option is through the serial port with STinG, but this is will be slow with the ST's 19,2Kbps limit.

Hi Terry.

I thought it was you and a couple others that ran into this problem. I first wrote Magic problem, then erased it and wrote NVDI, but I couldn't remember, thus the IIRC comment. I know it got fixed, I didn't realize that it was via CAB 2.7.

However someone not using the Magic NVDI combination should run into the said problem with CAB 2.5 and TOS or Geneva or Mint.

Thanks for the foggy clarification:-).

Brian.

There's also a speed penalty involved. Dithering 256 colour images to a 2
colour one takes processing time which is better spent looking after the
boot process.

Having said that, my CT2'd Falcon has a splash screen with a scan of the
Centek logo, very effective! :-)

Yes, it uses a 4040 chip and a few bits of wire. You need to cut one leg on
the MFP!

> But anyone I have downloaded so far is in German?? anything out there
> in English??

I'm surprised you can't find an English one. I don't have the file on this
m/c but you should look for SER38000.*

The method has also been written up in a number of mags.

Roger

In case AHDI is still your hard disk driver and it's a SCSI drive you need another driver. AHDI doesn't support SCSI drives larger than 1 GByte.
Regarding the usage of the cartridge with a PC you can either create media that are simultaneously PC and Atari compatible with the software inlcuded in the HDDRIVER package or you can install MiNT or MagiC on your Atari in order to be able to use PC compatible partitions larger than 32 MByte.

Visit the following URL: http://atarihacks.cjb.net/

It's a hardware hack page. Click on the DRIVES menu selection and scroll to the
bottom.
There you will find a file to download on making a SCSI interface.

Keep in mind though, $75 can save you time and headaches and give you something
that
works right out of the box. I'm also the same way, have a hard time giving up
that amount
of money since I don't have much to spend and live on. I managed to get lucky
recently
and get a ICD AdSCSI plus from a thrift shop for $4. Have you tried looking
there?

Good luck,

Thanks for the info.

I did manage to get the information on my EPROM burning software and get

a working image of TOS 1.04 and 1.00 onto a set of 6 27512's. I need to email
the new images to guy who runs the Atari ST Hardware Hack page. I used the
file he had on there for my first attempt. For some reason the TOS 1.04 doesn't
work. I found that 4 out of the 6 images have different ROM checksums than the
ones I created.

I'm wondering if the images he has are based on European versions of TOS and
are incompatible with US machines, or is that a completely wrong statement?

Well, my next step is to now get a CD-ROM, Syquest 44, and hard drive up

and running!!

Uwe,

Thanks thats exactly what I thought but, really wanted to make sure of it
Ill be purchasing HDDriver in a few months.

Thanks Don

Yes, it is a problem with CAB under MagiC (IIRC it's not a MagiC problem per se, it just shows up under MagiC for some reason which I forget), and happens when the URL gets too long for the window to display, hence the problem with search URLs and the like (a la Dejanews).

I haven't experienced the problem with 2.7 though I use it offline mostly. I also vaguely remember someone saying 2.6 onwards fixed this problem.

I did, some time ago.

I think the cable is UKP15. The other parts I'd need (HD interface, TOS upgrade, more RAM) push the price to nearly £100, which is just too much.

I already have an ST - CGA cable, bought from my local high-street electronics shop (Dixon's.) In fact, I have two, if anyone would like to buy one... There were only 2 left (and one Amiga one) so I took them all. VERY old stock.

> I think that today it would be mostly on a

Oh dear. It will stay empty then.

Ah! That would be good, but again, probably too expensive. Thanks!

You surprise me.

The standard is older than the ST, and was very common. Popular Amiga/ST/Archimedes monitors such as the Philips CM8844 were sold as "CGA compatible."

I already have the right cable, bought ready-made.

Haha. Yeah, really great. I'll bet a lot more than two "ordinary customers"
were stupid enough to pay for it in advance and haven't received a thing.
Now you learnt your lesson hopefully.

>> but the general distribution still seems to be held up for some reason.
Never mind distribution, they most likely just haven't got the goods.
Do you think they're just sitting on stock for the fun of it?

>> Cortex was in limbo most of the autumn due to illness in the family,
>> but last I heard (end of December, IIRC) that was about to change.
>
>Well, I've sent him a few mails the last couple of months, but without
>response. I'm considering legal actions,

Um, take a reality check.If Cortex had money worth suing for, you can
bet you'd be holding your Eclipse now. Why do you think: company name
changes??... Usually, when stock is not available and you can't get
in contact for long periods, it's due to financial difficulty,
overwhelming debts..

>but I'm a bit reluctant due to
>his family-situation. My patience is wearing out though.

What do you mean?? If a guy is so continually dis-honest, he deserves
to be punished. That's got nothing to do with anyone else. And besides,
how many people have seen with their own eyes that he has a family
problem?!!!!
Wake up. Just ask how many people paid Titan forNemesis (or worse, had a
Falcon destroyed by it....) and never received goods, same for DA's Layout,
Apex/upgrades..... All coincidental????
You know the score. Like that guy from Oz who lost several hundred
UKP on DA's. Apparently Dave Encill says the money was taken not by him,
but by Titan, and since Titan is no longer, responsibility=null!!.What
kinda shit is that??? (And it would take a very malicious mind to
invent such a pathetic story for any reason). What ever the law says,
would you place further trust in a company with such a policy and bad
history?! You are foolish.

Matt Y.

3108. CAB-OVL problem

Newsgroup: comp.sys.atari.st

From: Freek Munniksma <munkie@xs4all.nl>
Message-ID: <89p85p$4o5$1@news1.xs4all.nl>
Source record: 64892

Hello folks,

I have a problem with the latest versions of Dan Ackermans CAB-OVL like the 1.40. CAB will not recognize these versions. I copy CAB-OVL into the modules folder and start up CAB, but in the info menu it doesnt show. The Olivier Booklage versions like 5.66 do show up in the info menu of CAB and are being recognized. Am i forgetting something here?

Greetings, Freek Munniksma.

On 2 Mar 2000 18:54:36 G, Brian Van Tilborg wrote:

>If a NG could be created for AES then this would be great. The discussion
>would be for known reasons and not an argument like we see in this NG
>about the future of the Atari OS.

But of course, there is no need to restrict the discussion to AES only;
the issue is development of Atari OS as a whole.

Some of possible items for discussion that first occured to me:

* Complete replacement of current OS;
* Possibility of burning complete OS into EPROMs (size limit 512KB?);
* Integration of hard-disk/CD-ROM driver;
* Minimum hardware platorm;
* Modular design- exchangeable (X)BIOS/GEMDOS/VDI/AES/Desktop;
* TOS/MiNT/Magic/Geneva (in)compatibility;
* New OS functions; choice of OS functions;
* Preemptive multitasking;
* OS files standardization;
* etc...

(I know pretty well what I would like, and I am quite sure that it is
achievable; unfortunately my programming skills were mostly for the
VMS operating system and a prog.language that is not convenient here...)

As far as I know some steps in system evolution have been taken by the
Fenix project, but it doesn't seem to have advanced very far.

MIRROR SITES

FTP mirrors are alternative sites to certain popular ones which are
usually under a high load most of the time (many people accessing them
at the same time).
Mirror sites contain the exact same directories and files, but have
different entry points. Try to use the one closest to you geographically
and not during business hours (in that geographic area).

I should say don't use B5. It's some kind of hack to allow Hades user to
use HDdriver 7.7 and higher. On my hades B5 has proven to slow down the
whole system.

Futhermore on my system even with B5 I still can't access my SCSI-devices
when I use HDdriver 7.8. At boottime ext2fs can't access my ext2 partition
which is located on an external SCSI harddisk.
The only way I can access then is by switching off the 'instruction
cache'. By doing so the whole system becomes extremly slow.
For me B5 is quite useless.

To come back to your question, on my system -freemiNT 1.15.7b/N_AES/Thing
1.27b Aniplayer 2.09 doesn't even start up (ILLEGAL INSTRUCTION) when I
use B5. With B4 everytime works just fine.

> Since the Falcon and TT have no way to recognise what type of monitor
> is connected

Wrong. The Falcon can recognize the type of monitor attached, so it
wouldn't be a problem to add some code to MagiC to switch to the
resolution stored in the NV-RAM.

> MagicMilan boot in VGA 256 colors

Say, have you actually seen it? Mine boots in ST-High ...

Besides, if it were that dangerous to switch to a certain resolution
without checking the type of monitor (as you say), why is MagiC able to
switch to the resolution stored in magx.inf, once its AES is activated?
Is it less "dangerous", then?

Ciao

Hi,

Im trying to get a re-cased Falcon going again. Its been
re-cased in what I think is an Atari Topper case. The
keyboard has been separated and is connected to
the Falcon board using a small SIL connector with
3 pins.

Does anyone know which 3 pins on the Falcon main
board (J1B) connecto this fits to?

: One other thing. Besides my faithfull 520STFM i have picked up a STE
520
: with a bad power supply. Do these power supplys have a common fault?

First check all the passive components. Resistors are usually the ones that "die" first. You should desolder at least one end of the resistor before you start measuring. But firstly, inspect them for blackness or brownness. If they're black or brown they've been burnt.

Repairing power supply units is a special art. Everything is dependent on everything and you normally can not fix just one component and try the fix out. You must test them all... Try to follow the way of the current and what should happen to it after each component. You need some lamps to test with, they'll present a resistance and they will immediately show you if there is current or not. You will at various stages electrically detach one part of the PSU from its continuation and test with various loads (like lamps) whether it up to that point works OK. Be careful though! The current in the higher current part of the PSU could kill you, or injure you badly.

It has never happened that the same component has given in twice on repaired Atari PSU:s, which indicates that the design of the PSU is OK, but that the quality of the components used from factory is poor. I've heard of Atari Corporation's tactic of combing the market for second rate components which of course were cheaper than the standard ones.

MG

It's in no way great, obviously, but it does mean that there actually
are non-prototype Eclipses, which was why I mentioned it.

>were stupid enough to pay for it in advance and haven't received a thing.

It really is too bad that pre-payment is more or less a rule when it comes
to purchasing Atari hardware.
Of course, with such a small market it isn't easy for a company to front
the money for a production run without some down-payments.

>Now you learnt your lesson hopefully.

I don't have a lesson to learn here since I got one of the first
prototype Eclipse boards, for obvious reasons.

I really hope things will be cleared up for Jo Even and the others.

>> but the general distribution still seems to be held up for some reason.
>Never mind distribution, they most likely just haven't got the goods.

Noone in their right mind would order production of _two_ boards, so
you can be pretty certain there are more. I don't have any figures, though.

IIRC, the two boards I know about were both installed internally, by
David, so there was no need for external boxes (which I believe is the
major extra work needed).

>Do you think they're just sitting on stock for the fun of it?

I don't _know_ anything about what's actually going on, unfortunately.

>bet you'd be holding your Eclipse now. Why do you think: company name
>changes??... Usually, when stock is not available and you can't get
>in contact for long periods, it's due to financial difficulty,

...
>how many people have seen with their own eyes that he has a family
>problem?!!!!
>Wake up. Just ask how many people paid Titan forNemesis (or worse, had a
>Falcon destroyed by it....) and never received goods, same for DA's Layout,
>Apex/upgrades....... All coincidental????
...

We've all heard the stories, but very few of them (AFAICR) have been
from the people who actually (supposedly) had these problems.

I know from personal experience (with a certain German company, no
longer in business) how two parties can have very different ideas about
a transaction. About a year after paying for, and receiving, a Falcon
tower case, I got a letter threatening legal action unless I paid what
they claimed was missing from my first bank transfer (I'd made very sure
that it was correct, and they had after all sent me my case without
saying anything). After trying several times to get this cleared up (via
email and phone), I gave up and sent them what they asked for (it wasn't
much, fortunately, and I was tired of the hazzle).

Still, I'm not saying that all is or will be well with Cortex.
I really don't know at all what's going on lately, and it worries me too
(though not for financial reasons).

I remember seeing a picture of a Power Glove connected to an Atari in the French ST Magazine in the early 90's. I might also have seen one of these myself at the Atari Messe in Dusseldorf in 1993 (I'm not sure though). What this Power Glove was used for, I have no idea.

Maybe you should post in fr.comp.sys.atari and ask the people there if they can find the isse of ST Magazine where that picture appeared and tell you what the article says about this particular device.

Good luck

Denis

Freek - I had a similar problem, but with me it was Dan's former Ovl that keep being displayed in the CAB information screen. I just eliminated all the other "ovls" and the related INF and RSC files relating to interfacing CAB with the outside world and Dan's latest version then showed up. Not sure why this happened, but it did :)

AFAICR CAB looks for CAB.OVL in the directory where it's started from.
If it can't find the overlay there, it looks in \MODULES to see if
there's one there. If it still can't find one, it gives up and works as
an off-line browser.

On 3 Mar 2000 22:44:40 G, Neil Chester wrote:
>Is this "FASTserial" available anywhere? Can STiNG hook-up with it? Is
>it usable with Magic 6?

Yes, it is available on various FTP sites. Yes, STiNG works with it.
However, Magic 6 doesn't seem to like it much. Here's what I've found
in my experimentation with both Fast Serial and HS Modem:

1. Fast Serial is extremely easy to set up compared to HS Modem.
2. Under Geneva, Fast Serial work faster than HS Modem.
3. Under Magic 6, Fast Serial doesn't work at all. :(
4. Some software (COMA for instance?) doesn't work without HS Modem.
5. Supposedly, HS Modem has more features for network situations,
however, I haven't found any problems with Fast Serial in just a
dial-in modem connection.
6. HS Modem causes the modem to drop it's link in some way to the
computer until it is re-established by the software, so some
Terminal programs such as Storm can't connect unless you run
something that does this (like running the STiNG dialer, hitting
"Enable", quitting, and then running Storm).

I'll try to find out where I got Fast Serial and post it or E-mail it
to anyone interested.

From: karlws@zetnet.co.uk
Message-ID: <38c0a529$0$20633@znews.zetnet.co.uk>
Source record: 64813

Does antone know how I can copy my old '33' and '45' on to CD's.
What software will I need to sample them, some might need to be cleaned
up as they are a bit old, then write them to CD, them be able to be
played a music CD player?
I have a STe (veloce) and a Falcon (1st), hoping to get a CD re-writer as
soon as I drop on one at the right price.
Wheres the best place to get whats needed?
Thanks for any help.

> an off-line browser.

David - thats the way it is suppose to work. The problem I encountered is that, for some reason, the newest files did not overwrite the older CAB OVL and its INF file, even though the computer thought it had. I had to trash the older version before copying the latest OVL and INF files into the modules folder. Only then did CAB report the correct version in its info box. And I knew that the right OVL was really being used as I could now access sites that would have caused CAB to crash using the previous OVL.

Your card is a Magnum memory card. Depending on the RAM installed, it can
provide up to 14 M RAM, IIRC.

What you need is the software kit that goes with the card. Last time I
checked, it could be downloaded from Software-Service Seidel:
http://www.seidel-soft.de/atari/ramchips.html

3130. [?] About GEMScript

Newsgroup: comp.sys.atari.st
Date: 2000-03-04 00:00:00 UTC
From: ptonthat@club-internet.fr
Message-ID: <89qj02$2cr$1@front6.grolier.fr>
Source record: 64817

Bonjour :)

I'm implementing (or trying to) GEMScript in Joe. Studying the
German developper documentation,

1) I would like to know if the commands are case-sensitive like in
common scripts or C language.

for example, read in the doku: Save
and in FreeBase doku : save

2) Moreover, how the GS_ACK with string answer and successful call
differs from GS_ACK with message failure, I didn't manage to uncipher
this part.

3) Where can I find the interpretor for .SIC files? There's the
Scripter from ASH, but I (wronly?) think it's a commercial and
expensive product. Is there another free?

4) During the execution of the script, is the controlled application
responsive for others events (such as user keypress or mouse click)?
What must be the application's behavior?

Thanks for answering

bye

Rajah Lone
ptonthat@club-internet.fr

NB: I received 0 bugreport for the Joe 1.47 alpha I released.
I doubt it has 0 bugs, I'll thus take my few time to test it, so
be more patient.

Yes, it connects to the computer via SCSI. I have been thinking about ACSI
but SCSI is the priority at the moment. Nevertheless you should be able to
connect to an ST by using an already available ACSI-SCSI adapter like the
Link 97.

Hi Steve

Yes,- I know that one. The problem is that on my old modem, a X-Link 28800, I initate the modem with this command: AT&FX1\T90
But that didn`t work on the 3Com Robotics 56K. It is mainly the inactivity timer I need, and the need to tell the modem not to wait for a dialtone. That was the (X1) command.
I have a special Internet line with no tone at all. I know I can set the timer in the S=register. But the command that tells the modem not to wait for the dial tone gives me more gray hair.

On 4 Mar 2000 05:54:49 G, Karl Smith wrote:
> Does antone know how I can copy my old '33' and '45' on to CD's.

You can buy a stand-alone CD recorder unit (hi-fi component type)
but the "consumer" ones tend to have poor A/D:D/A conversion, and
the professional units have price tags to match. In both cases,
you have very limited functionality - can't use them as computer
CD drives.

>What software will I need to sample them, some might need to be cleaned
>up as they are a bit old, then write them to CD, them be able to be
>played a music CD player?

You need a Line Audio FAD 2/2 high-quality stereo A/D:D/A convertor
unit and Jam Sample Clock (44.1KHz version). For recording (up to
8 tracks), SoundPool Audio Tracker. For cleaning up noise, SoundPool
DeNoiser. For revitalising dynamics (inevitable with analogue media),
SoundPool Dynamite Multi-Dynamics Processor. For writing professional
Red Book audio (suitable for use as mass duplication masters),
SoundPool CDRecorder. For audio CDs that can simply be played on
domestic CD players, Anodyne's CDWriter.

The SoundPool products are not cheap, and neither are the results
you get from them. Very high quality and professional.

> I have a STe (veloce) and a Falcon (1st),

Forget the STe. There are no readily available audio recording
solutions (for CD mastering, at least).

> hoping to get a CD re-writer as
>soon as I drop on one at the right price.

They're now very affordable anyway, with models from Yamaha and Plextor
costing almost half what they did a year ago. Don't bother with very
old second hand or very cheap stuff. These things are already amazingly
affordable for what they do.

IIRC it should look like this:

Dip 1 Dip 2 Dip 3
off on on

>Can I add an old 80meg SCSI mac drive?
Yes

>Can I swap the syquest for a SCSI CD-ROM?
Yes

- Make sure that parity on both drives is *DISABLED*
- You should set the SCSI ID on *BOTH* drives to 0
- Try to make the flatcable as short as possible
- Do not terminate the drives, the hostadaptor is terminated.

Good luck...

Yes it's Selectric. OK I'll try and explain it better, let's say I want to copy a paragraph from the post numbered 165690 in c.s.a.st. to somewhere else, I go to Everest and click on [open] go to the CSAST folder to get 165690, the file selector comes up but shows the directory is empty.

However, Open up a window on the desktop, bring up the CSAST folder and there are 49 files showing, go back to Newsie it reads "Newsgroup contains 48 articles..." (i.e. 48+1 for the xover.txt). Click on [followup] as I've just done to respond and Everest opens up with the post and saves the followup OK which still doesn't appear in the directory.

If I use Editress or Tempus then it shows that the directory is not empty but contains 5 items (!?). I tried First Word Plus and the [file] box in CAB as well - the all show the directory is empty.

Does this make better sense? :-)

Some years ago I had a power supply go bad. Replaced it with a new one and
rather than just throw out the original, I tried reheating all of the solder
points on the circuit board. Seems I had a cold solder joint and reheating
corrected the problem. Ended up with a spare good power supply. After it sat
on the shelf for a year, I sold it. Its still working great.

I've never done any hardware hacking on my Atari since I bought it in 1991. Not necessary, though the alternative *is* usually paying someone to do the work. These days it's more of an issue depending on geography/availability of dealers etc. In the UK there are still companies around but like you said in your other posts it may not be worth it on a 20-quid Mega2. Best bet would be to get an STE if you want to expand the memory cheaply.

OTOH, if you can get it to work, 2 megs and a single floppy is usable for a lot, depending on what you had in mind. Remember most Atari software up till recently was aimed at 1 meg, single floppy systems. For net software you could do with a hard drive and more memory, plus some kind of multitasking OS, but you can just about do basic email and web browsing with 1 meg and a single floppy with single TOS (with serious limitations though). Depends what you actually want to do with the machine WRT the FreeGEM project.

[snip]

> VERY old stock.

I assume that CGA is standard RGB as used with Philips Atari/Amiga monitors from your other postings. Limitation will be that you only get up to medium res, and Atari software (with the exception of games etc) tends to be at its best in at least high res (mono) :-(

At a pinch you could try a software mono emulator (lets you use high res software on a medium res display). Won't work for everything and may not do your eyes much good, though! Keep your eyes peeled for a mono monitor

for sale or being given away, they are usually cheap (eg I have a second one which I got together with a Philips colour monitor for UKP25 for both a couple of years ago). ISTR that someone was giving one away in this group recently.

HTH

Hi John!

From my own Falcon030 P/S problem, it seems that cold solder joints, and a bad cap, which is what died on mine, cause the most problem.

I have a buddy from my Atari group, who loves to tinker, and I took the old Falcon P/S and let him have it to look at. I haven't tried it, because my reserve is working well, but the old one no longer blows fuses when powered up.

Hope this helps!

I'm setting up my old TT030 system to my business documents. I was planning on using Calamus for some of the documents, but after looking at the Papyrus manual again, I'd prefer to use Papyrus.

However, I have a problem with the fill patterns in Papyrus. They look terrible when printed. Using Calamus terms, it would appear that the line screen setting in PAP is too high. Unlike Calamus, it does not appear to be user adjustable.

Is there a byte or two somewhere in the PAP program code that can be changed with a sector editor to decrease the line screen?

Thanks, everyone.

Same thing exists on my Hades. On bootup, I do not get the CD ROM drive listed, just my Jaz and IDE drive. However, my drive works and is recognized by Extendos Gold. I agree with Derrick in in that the CDROM's SCSI ID must be enabled in HDDriver.

I have a Hades 060, NVDI, Magic 6.1 and Jinnee (along with other things). I have the Magic Intro Screen setup to come up, but I do not get. Anyone know why that could be??? It is no big deal, but it would be nice to see it.

Just to let all Hades owners know that Aniplay 2.09 does not work too well with the Hades accessary B5. Aniplay loads ok and plays the animation videos like a dream. The problem comes when you want to quit. My Hades gives me a bus error. I think it has something to do with the Intruction or Data caches. I know B5 was designed to work with version 7.71 (and greater) of HDDriver. If other Hades owners do not experience this, please let me know. I have switched to using B4 and things are great.

>Yes, but then there would have to be a seperate MagiC Falcon version...

Well, not necessarily. What I'm saying is, ASH could put a simple
command into the MAGX.INF file that allows the user to switch to
whatever graphics mode the user wants just as it's displaying the
"splash screen" bootup image. That way, leave the command out and it
works exactly as Magic does now. But put it in, and once Magic reads
the MAGX.INF file it can first change to the graphics mode the user
wants, and then display the image.

>MagiC replaces the complete OS unlike MinT and Geneva. In fact one could throw

Right. Understood.

>change this, otherwise people with ST's would risk their color monitor or TV.

Falcons do recognize their monitor type, don't they? When I had an ST
RGB monitor connected, the computer would allow me to use certain
modes and adjust its given settings to accomodate that. When I got a
Multisync, these changed. Why shouldn't Magic be able to use the same
detection method?

>So, what it comes down to is that when using a Falcon or TT one is stuck with
>the monochrome boot up screen with a maximum size of 600x400.
>MagiCMac, MagiCPC and MagicMilan boot in VGA 256 colors, because on these
>machines it's not necessary to check the connected monitor.

Why doesn't Magic look at the NVRAM settings, or if the computer has NVRAM or not? Is NVRAM a part of the TOS ROM? If it did, it would be easy to change the default setting, just as you can for boot-up without Magic. Anyway, just a thought or two...

That's the thing.

My Amiga was free, but adding a monitor, 68030 CPU, 10MB RAM, a 400MB hard disk and SCSI has cost, all in, about UKP50. /That/ I don't mind paying.

Doing the same to the Mega will be a LOT more.

I didn't expect this! It's very disappointing. I thought the Mega was an expandable machine, but it's not, really.

There doesn't seem to be an ST equivalent to the highly- and cheaply-expandable Amiga 1200, with its PCMCIA slot, trapdoor expansion bus and onboard IDE controller.

It may prove more cost-effective to just sell it and run GEMulator.

> Depends what you actually want to do with the
> machine WRT the FreeGEM project.

Look at and try the different versions of TOS/GEM and other OSs, compare and contrast. Maybe look at some open-source ST apps with a view to portability.

Not much, really.

>Ideas....

This seems to have come up a few times so your not the only one to
have this.
When I installed the original distribution disks of NVDI 5.02
everything was fine no problems. I initialy downloaded the 5.03
(german version) update from the B&B site and on installation the
printer cpx vanished. On chatting to a few people realised this
shouldn't have happened and downloaded the now available english 5.03
version and this worked fine - no problems. All I can suggest is
trying this upgrade and disable all unnessasary auto/acc/start
programs and have a totally clean boot before installing the patch.

Regards
Sean

Hi Ed,
Although I'm running a stock Falcon, I did have that problem (NVDI 5.1)
after Running Warp9 & Outburst (w/o NVDI). After resetting with NVDI running
again (no Warp9 or Outburst) the printer cpx died and I had to re-install
NVDI to get the cpx up again. Just my 2 cents!

3154. HD Driver and Linux68K

Newsgroup: comp.sys.atari.st
Date: 2000-03-04 00:00:00 UTC
From: scornio@erols.com
Message-ID: <38c15833.9977773@news.erols.com>
Source record: 64841

I'm using HD Driver 7.55 with a 4GB disk in my Falcon30. I formatted it 32MB, 500MB, 500MB, 500MB, 500MB, 1000MB, 32MB, and aproximately 940MB. This gives me drives C thru J. I installed Linux68K using the last two partitions, one for swap and one for linux itself. When I used to do this with ICD Pro, the last two partitions would no longer be seen when in TOS mode. HD Driver still reserves I and J for these last two partitions but TOS can't see them. When I mount a Syquest cartridge, its partitions start at K. How can I get HD Driver to ignore these last two partitions?

A second question concerns HD Driver 7.8. I have tested the demo version and I noticed that in HDDRUTIL there is an item under Tools marked Bus Rescan. I assume that this rescans the SCSI bus. This is good because I am always changing cartriges in my 4 Syquest drives, 2 Syjets and 2 old 44MB drives. Is this function available within the CPX which comes with the commercial version of 7.8?

Thanks
Steve Cornio

Buy a PC and get a copy of Easy CD Creator Deluxe v4. The software has an add on that allows input from records and tapes. The software uses different filters to get rid of 'clicks' and brightens up tape playback. Once on the PC they are in WAV format so you can write them to CD.

I have loads of LPs that I need to convert (some I have started).

If this is too hard, I also did a copy using a mini-disc player. Record the record to MD via the headphone socket then play it back in a suitably equiped PC/Atari ready for writing to CD.

On 4 Mar 2000 10:58:57 G, Trevor Spencer wrote:

| . . . .
|Yes it's Selectric. OK I'll try and explain it better, let's say I want
|to copy a paragraph from the post numbered 165690 in c.s.a.st. to
|somewhere else, I go to Everest and click on [open] go to the CSAST
|folder to get 165690, the file selector comes up but shows the directory
|is empty.
|
|However, Open up a window on the desktop, bring up the CSAST folder and
|there are 49 files showing, go back to Newsie it reads "Newsgroup contains
|48 articles..." (i.e. 48+1 for the xover.txt). Click on [followup] as
|I've just done to respond and Everest opens up with the post and saves the
|followup OK which still doesn't appear in the directory.
|
|If I use Editress or Tempus then it shows that the directory is not empty
|but contains 5 items (!?). I tried First Word Plus and the [file] box in
|CAB as well - the all show the directory is empty.
|
|Does this make better sense? :-)

I wonder if the .ext popup in Selectric is set to something other
than '*.*'? If all your files are *.TXT, and the popup shows *.DOC
(for instance) then you won't see anything.

Hello please can someone help me with a couple of things?
Ive tried hard to get "make disk" (ver 1 and 2) to work with no success. Is there any other way of getting the st file on the net back to st disk?
please help as i am getting very frustrated with this.
One other thing. Besides my faithfull 520STFM i have picked up a STE 520 with a bad power supply. Do these power supplys have a common fault? Im trying to work out what component is dead on the power supply board but its difficult. Can someone help with any ideas? :-)
Thanks in hope.

Updated as of 03/05/00
New items added

I have a limited amount of brand new Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (all contain one controller, RF Box and AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $50
- Atari Jaguar with CyberMorph cartridge $40
- Atari Jaguar (No Cart) $30

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $15
- RF Switch Box $10

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working SONY SAT-A50 DSS Satellite Receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

3167. Questions about printing

Newsgroup: comp.sys.atari.st
Date: 2000-03-05 00:00:00 UTC
From: staylor640@NOSPAMaol.com
Message-ID: <7Dow4.232$tq2.32777@wdc-read-01.qwest.net>
Source record: 64763

Hi all,

I am continuing to upgrade my Falcon system (14 meg RAM, 80 meg HD, TOS). Last week I upgraded to NVDI 5.03. Today I bought an Epson Stylus Color 740. I have a couple of questions about printing:

1. Printing 360 dpi B&W is fast, but anything with a higher resolution or more colors is painfully slow. I tried the IPRN demo that came with NVDI 5, but it just seemed to lock up my Falcon whenever I tried to print. Should IPRN work, or is there a better way to speed up the printing?

2. I want to see how well this prints out color photos. Are there any freeware or shareware programs I could use to print out JPG files? I tried to use the Papyrus 6 demo, but it gave me an error message (in German, of course, so I don't know what was wrong; it was fine printing just text). I tried to use Vision, but it gave me an error that it could not find any GDOS drivers.

Thanks for your advice.

Steve

3169. Fractal Music Composer version 2

Newsgroup: comp.sys.atari.st
Date: 2000-03-05 00:00:00 UTC
From: tconrardy@hotmail.com
Message-ID: <Fkpw4.314$eU4.12934@nuq-read.news.verio.net>
Source record: 64765

Hugh McDowell has produced a new version of his FRACTAL MUSIC COMPOSER program. In the First Incarnation (which is widely available on most Atari FTP sites) it was a set of 3 seperate programs that ran independantly of each other. In this "new" incarnation, he has combined these programs to form one composite application with many new functions and features.

The Demo is now availabale at my site, with Info on how to get the full version. The Demo however is VERY USABLE. You can save custom scales as well as all your settings to disc.

The past few days of just playing with the demo , I can up with some great stuff, especially after inputting my own scales and using That in combination with the mandalbrot Graphics I was able to make some mesmirizing music. Great Stuff!

So Please check it out.

>
>I can load a newer TOS from disk?

Yes! TOS image files can be found on the Net and there are also various
"loader" programs- though I hear that not all will always work. I think
that Pera Putnik has loaders for several TOS versions on his page.
There is also on Atari ftp sites a TOSPATCH program that alows you to
customize TOS2.06 in some details and to correct several bugs. It also
includes a loader. A nice detail is that it can make TOS2.06 reset-proof,
so that, once loaded, it will stay in RAM most of the time, except in some
severe system crash. I use it like that on my Mega.

Before I installed a hard disk I sometimes used an auto-loading reset-proof
"bootable" RAM-disk that was seen by the system as the C:\ hard disk.
On this I put the desktop-icons file used by TOS, desk accessories
such as the control-panel, auto-folder programs, a couple of often-used
utilities,etc. It made work more comfortable. A setup like this
should leave you with more than 1MB RAM free on your 2MB Mega.
You may launch NVDI this way, though then the things become a little bit
too tight in RAM and on the floppy.

>> By the way, you are in the US, aren't you?
>
>Good grief no!
>Note the UK email address.

Oh, I didn't notice. Nice attitude, btw :)

>> Ahm, a positive attitude towards hardware hacking seems to be a
>> prerequisite for an Atari user :)
>
>I think I won't be one, then...

I think you should try using it first as it is. Then, if you like it,
maybe you will resolve more easily to make some upgrade. A Mega with
floppy only can be used quite efficiently. The DS/DD floppies are usually
formatted to 820-840KB, and even, if you have been lucky with the
floppy drive, to 924KB (84 tracks x 11 sectors). This was quite
reliable for me. Wit a HD-floppy modification, it this can be doubled.

But this discussion sems to be steering away from the original problem:
can that Mega be made to work. If it can't, all this talk is pointless.

So- did you have some success in making it operational? It would be a pity if it can't work. In my opinion, it is a very pretty-looking little computer with one of the best keyboards that I have ever used.

>Ah! That would be good, but again, probably too expensive. Thanks!

The sad truth about Ataris is that all expansions, unless done by yourself, were always a bit too expensive. Especially adding a hard disk, because of the high prices of SCSI host adaptors. :(

>I already have an ST - CGA cable, bought from my local high-street
>electronics shop (Dixon's.) In fact, I have two

Ah, so you, at least, already have that funny DIN connector. Below is an extract from a file I found among some docs, describing the VGA connnection. I didn't use this, so I can not guarantee that everything is correct. E.g. I seem to remember that the three resistors mentioned here should not have the same (47ohm) value if you want to get a correct white n ST-High on a colour VGA monitor.

--- quote:

The ST series has the following video connector:

4 3 2 1

8 7 6 5

12 11 10 9

13

1=audio
2=csync, or when the ST has a TV modulator, then it is composite video
3=port A bit 6 of sound chip
4=monochrome sensor, low = SM124 monocrome monitor
5=audio input (no a/d!!!, only mixed to audio out.)
6=green
7=red
8=+12V (TV can detect if a video signal is present)
9=hsync
10=blue
11=monchrome video = SM124
12=vsync
13=ground

VGA has the following pin out:

\ 1 2 3 4 5 /
\ 6 7 8 9 10 /
\ 11 12 13 14 15 /

1=red
2=green
3=blue

4=not connected
5=digital ground
6=analog ground for red
7=analog ground for green
8=analog ground for blue
9=not connected
10=digital ground
11=not connected
12=DCC data in/out
13=hsync
14=vsync
16=DDC clock

(DDC=Display Data Channel, so Windows 95 detects PnP monitors)

Connect the st connector to VGA connector with the same function following
the above listed connectors. All connectors are viewed from the solder side.
On the VGA you use digital ground to the ST ground. This will do color lowres
and medres resolution.

Note: The most actual VGA monitors can NOT show 15kHz horizontal sync as the
ST does in low and medres

Monochrome highres resolution on a VGA connector.

link ST hsync and ST vsync to the same pins of the VGA connector
link ST monochrome video over 3 x 47 ohm resistors to red, green, blue, one
resistor for one color!
link ST monochrome sensor to ST ground
link ST ground to VGA digital ground.

Source record: 64768
Cross-posted to: alt.demogroups,alt.anybody,alt.www.sites,comp.sys.atari.st,alt.crews.atari

Are you a member of the former Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990?

Then you should not wait a second longer and surf over to http://stniccc2000.atari.org to discover that, in fact, a reunion of that very historical event is being organised for December 2000, a 10th anniversary reunion as it were! It is going to be the coolest event of the millenium, I can assure you!
In case you've already surfed over to that site in the past year or so, be advised to check it out again, as it's been overhauled utterly! It looks way cooler now, and contains a lot more information!

3173. Atari ST/TT/Falcon Ultimate Virus Killer 2000

Newsgroup: comp.sys.atari.st
Date: 2000-03-05 00:00:00 UTC
From: Richard Karsmakers <richard@fortysecond.net>

3175. Help: Vortex HDplus 40 info needed

Newsgroup: comp.sys.atari.st
Date: 2000-03-05 00:00:00 UTC
From: Steve Stupple <Steve@atari.org>
Message-ID: <XcAjYCA8flw4EwrH@steverosie.demon.co.uk>
Source record: 64771
Cross-posted to: comp.sys.atari.st,alt.atari,comp.sys.atari.st.tech

Hi

I'm after info for the above hard drive: another Atarian has bought a so called working drive and can't get any life from it, hence I'm trying to sort it out for him.

What sort of hard drive mech is it: SCSI, MFM, RLL...

The drive inside it does not have the standard SCSI connector, but an 40-pin IDE type connector.

The drive spins up, when powered and goes through the usual motions when NO interface cable is connected. When the cable is attached and powered up it does bugger all except spin up, there is no motor or movement detected.

Using HD driver and ICD's ID check it pauses for 4-5 minutes when it comes to the ID it supposed to be!

Also, although unlikely, I wondered if the drive uses SPECIFIC software to access the drive!!!

The manual doesn't give very much info on it at all.

Any help will be more than appreciated and

Stephen Cornio wrote:

> last two partitions but TOS can't see them. When I mount a Syquest
> cartridge, its partitions start at K. How can I get HD Driver to
> ignore these last two partitions?

HDDRIVER ignores any partitions that don't have one of the recognized
partition types or the XHDI type RAW. So if these are LNX partitions
HDDRIVER will ignore them unless you have configured HDDRIVER not to do
so, e. g. because you want to use them with MiNT. Please refer to the
manual for details.

> CPX which comes with the commercial version of 7.8?

The bus rescan doesn't influence HDDRIVER itself but only some software
using the built-in SCSI Driver. It's not offered by the CPX but you can
use the SCSI.CPX by Steffen Engel to do the same.
Regarding cartridges with a different number of partitions the removable
media settings are important, not the bus rescan. Once again I recommend
to refer to the manual for more information on these settings.

I can't answer your IPRN question, but the higher the dpi you print at, the slower it will be. This is true on all computer platforms, Assuming equally powered computers.

Why? Because if you double the dpi resolution you are using to print, the computer has to send 4 times the amount of information to the printer.

>outside world and Dan's latest version then showed up. Not sure why this happened,
>but it did :)

I've just tried out Oliver Booklage's 5.6800 version with CAB, and that worked fine. I have 5 different overlays in my MODULES folder at present, all marked with the version number (or IConnect, which I can't get to dial). When I want to use one, I use a useful trick that Derryck Croker showed me: Copy the wanted one within the folder and when the OS complains of name duplication, just rename it to cab.ovl; you'll get another warning but OK that - and Bob's your uncle, as we say here :-)

Of Dan's overlays I have the Falcon030, 1.2706 and 1.2904 versions; I am not sure what these offer compared to Oliver's. Have not yet tried any later versions - but I have only just succeeded, after much help from Derryck, to get a good net connection, downloading files from Uwe Seimet's page.

Is there an easy way to find such downloads without having to look through all the folders in my cache? (I don't have an ftp client installed yet.)

Regards, /Peter/

Are you sure about this? I agree about the boot-up phase being in mono only (I have switched off the picture in my MAGX.INF), but using the 'Change resolution' menu entry in Thing offers me only 600*400 when I plug in my SM124, but 5 colour resolutions up to 768*480 interlaced when I plug in the CM8852 RGB colour monitor - and even more, as I recall, with an SVGA monitor. So the monitor used is certainly recognised somewhere (Magic, Thing?).

3182. Transfer C-Lab Notator MIDI sysex from Atarti to PC?

Newsgroup: comp.sys.atari.st
Date: 2000-03-05 00:00:00 UTC
From: rb@jupiter.org
Message-ID: <38c2a646.4303214@news.edmonton.telusplanet.net>
Source record: 64778

Here's my situation:

I have some C-Lab Notator system exclusive data saved on Atari
floppies.

My end goal, if this is possible, is to convert this stuff into MIDI
standard file sysex data for my PC.

I no longer have the Notator software.

Any suggestions?

I recommend the latest version from Dan's site (1.40) as this allows
you to get to more sites due to the better cookie implementation. I
don't know about the Falcon version but the standard version is the
best I've used so far.
Available from URL: http://www.netset.com/~baldrick/

>Is there an easy way to find such downloads without having to look
>through all the folders in my cache? (I don't have an ftp client

I tend to check out 5 main sites for news of new releases and
references to authors/software:

Jan's Daldrup's Place2be site URL: http://www.place2be/indexe.htm
Atari Organisation's site URL: http://www.atari.org/
Bengy's MagiC Online site URL: http://bengy.atari-computer.com/
Halvard's site : http://www.geocities.com/SiliconValley/Bay/8745/index.html
And the FTP site which I always check for up to date software is the site:
chapelie.rma.ac.be directory: /atari/

Best Wishes
Sean

PB> I need an Atari that I can run Notator on. So if you have one for
PB> sale in the USA let me know please. No Falcons anything 1040 or
PB> bigger is fine.

I've been running this ad from time to time.

The time has come for a new owner for the Bear Cavern BBS's equipment.

The following Atari equipment and software are for sale for $500 plus handling and shipping.

1 Atari Mega 4 STe equipt with 50 MB hard drive, Ajax chip, 1.44 floppy drive. With a JinMouse (better than an Atari Mouse).

1 Atari 14" swivel base monochrome monitors.

1 Atari SC1224 color monitor.

1 1.1 Gigabit Seagate SCSI Toad Tower Hard Drive with Adaptic card.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
This hard drive is the one used with the BBS and contains several hundred Atari, MSDOS and Windows files.

1 540 MB Quantum hard drive with an ICD II adapter.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
Built in the same box, a 750 kb floppy drive. The floppy is good but the cord length makes it unreliable. Best to remove it and use it as intended.

The BBS software is BB/ST by Quantum Microsystems. Old but reliable.
The program has been improved by Anthony Watson (Mountain Software), improving the file library and the File attached Mail.

Maintenance software on the BBS includes, Diamond Edge, Diamond Back, ICD Pro Utilities, SCSIWAIT 3.

Two external SupraFAXmodems, 1 v32.bis and the other 33.6 (these are the ones with the display)

Dozens, if not hundreds of 750 kb disks with commercial software, Magazine files, and STReports downloads and manuals. (Also the Best Electronics catalog).

Cords, powered monitor switch (will switch from one monitor to another including the AC)

Mega STe Field Manual

Lots of software

Need to know more? Give me a call at: (360) 573-3333

Gemulator may be the best way of comparing TOS versions (largely as thay
are chip-based and often machine specific), if you can get them to run
with it. I was thinking of investigating it at one point but people here
seemed to have terrible trouble getting it to run and it looked like TOS
2.06 was the only version that really got on with it, IIRC.

Hi Ken,

KM>I've seen a cable being sold from Best :Electronics to hook a SCSI
KM>hard drive up. The problem is that :it's $75.
it's not only a cable. You need an ACSI-SCSI 'host'adapter. In the
beginning (of ST, of course) this was a small (about twice a cigarette
packet), but afterwards third party companies were able to include
this board into a (a bit larger than usual) jack of a the modified
SCSI cable called 'Link95' (or similar), later on LINK96 ...

So, 75 bucks seems reasonable for a new one, but you should try to get
such an adapter second hand.

From '91 on, I had an ICD adapter that still works fine!

Here in Germany the time has come when ST computers are offered as
gifts. Sad but true. A friend fo mine was given a free Mega STE, and
now I try to attach a SCSI drive of my own to his 'new' computer, but
the original Atari adapter behaves not like a TT's one.

You'll need to change some of the settings in Sting. I've changed the
settings quite often in the past. ATM, it's been working very well and
haven't changed much of anything in the past few months. Let me know in
e-mail and I'll send you my Default.CFG and Dial.SCR files for Sting 1.22.

Hello people,

I created a general Atari emulation mailinglist at egroups.
People who wanna join can send an e-mail to:
atari-emul8-subscribe@egroups.com.

Please keep in mind that is a general Atari Emulation list.
People who wanna talk about the emulation of a 2600VCS can
subscribe to :)

Yours,

Niels Wagenaar

3198. Atari Hard drive appears not to be working

Newsgroup: comp.sys.atari.st
Date: 2000-03-06 00:00:00 UTC
From: j.m.whitehead@sheffield.ac.uk
Message-ID: <38C3BAA3.E4FD2B55@sheffield.ac.uk>
Source record: 64649

I recently acquired some old atari hardware consisting of :

a mega st4
a 1020 stf
a SH204 hard drive with the drive marked ST225 internally.
a couple of bw sm124 monitor

and my problem with them is that the hard drive doesn't seem to be accessible via the desktop. When I set the kit up initially the hard drive was plugged into the mega st4 so I connected it all up to the power, turned it all on and the GEM desktop appeared with only the 2 disk drive icons. Should the hard disk automatically be detected or do i need to set it up some how. I didn't get any manuals or disks with the hardware so it could be there is some sort of driver disk which I need to get.

Can anyone help me out here?

Cheers,

Jon.

Fair enough, tho' as you say, I think I've only got 2.06 to work on it so
far.

I have found a cheap SCSI link, though, so the Mega may get a little
further.

No monitor so far, so I don't know!

> It would be a
> pity if it can't work. In my opinion, it is a very pretty-looking
> little computer with one of the best keyboards that I have ever used.

It looks good, but I tend to expect 3-box computers to be made that way for expandability, and this one doesn't seem to be.

I wasn't especially impressed with the keyboard so far, though.

> The sad truth about Ataris is that all expansions, unless done by
> yourself,
> were always a bit too expensive. Especially adding a hard disk, because
> of the high prices of SCSI host adaptors. :(

:�(

As for the video cable, I bought a complete cable, not just the connector. I'll have to stay with CGA until I buy the adaptor. Now, if only I can get the screen to work...

3206. boot problem

Newsgroup: comp.sys.atari.st
Date: 2000-03-06 00:00:00 UTC
From: Chris Rupert <crupert@netrover.com>
Message-ID: <J0Uw4.30395$Jz3.219986@nnrp1.uunet.ca>
Source record: 64657

Hey all;

I can't get my STf to boot properly.To make a long story short, i changed a CPX file to something (I thing the original name was GENERAL.CPX) to GENERAL.ACC. This program is in my root directory on my HD. Now, the system won't complete the boot process - it shows all my HD info, etc, then starts over, but never gets to the desktop. Obviously, I shouldn't have changed the extension on that file, but how do I access the HD to fix it?

Thanks

Sure, nice and useless... :) Seriously, any setup which leaves about 1MB
is more-less acceptableon an Atari; I mentioned NVDI, etc. just because
you said you wanted to test the feel of TOS versions and extensions,
in which case you probably wouldn't run RAM-demanding applications.

>I wasn't especially impressed with the keyboard so far, though.

Some Mega ST-s somehow acquired keyboards from Mega STE-s, which were
indeed bad, they say; (btw. recognized by square function keys instead of
skewed ones)

>> So- did you have some success in making it operational?

Khm, I was thinking that a friend- the one with an volt/ohmmeter and a
soldering iron :) might reconnect that cable for you to make a
ST-Mono-to-VGA setup, (change CGA to VGA D-connector and reconnect wires
as needed)...

Ooops! the 'if I change the extension what will happen' syndrome!

Pressing a key upon boot up usually allows the bypassing of the hard
drive boot up process. It's usually either the control, alt or shift
key, it's along time since I've needed to use it.

Failing that, turn the hard drive OFF and boot the system from floppy.
The run the hard drive driver from the desktop! you should then be able
to access you hard drive, there you can change the extension back again.

At this point it may be worth considering a hard disk boot manager, or
moving the CPX module in their own folder!

You don't have to run the same driver that is installed on your hard
drive, all you need is any hard disk driver that access to your hard
drive.

Try switching on the drive, and letting it spin up for 10 seconds, then
switch on the ST.

Try creating a C icon on the desktop with the Options > Install Icon menu.

If the above don't work, download AHDI from my site and try re-installing
the driver with ahdi and making the drive bootable with the hinstall
utility.

CPX files require XCONTROL.ACC to run. I've never yet met a CPX that can be
simply renamed to .ACC to run as an accessory.

Easy, boot up with the Control key pressed. This should boot to the C drive
and bypass any ACCs or AUTO progs. If you press Alt during boot, it should
boot on the floppy drive where you will have inserted a disk with AHDI in
the AUTO folder. You can get AHDI from http://bales.online.fr/atari/files

Hi Ken. One posibility is that your objects are optimized for screen and not printer output. This way they are 90 dpi instead of the full printer resolution (300dpi on the SLM). You can change that setting on the object
attribute dialog.

Hope this helps.

Daniel.

Latest news from the Magic Online website"

Milan News! (March 4)
As earlier reported, the Milan II is scheduled to make it's first public appearance at the Silicium expo in France this weekend. Although not there yet, early details suggest that the Milan II will be there, but in modified form. The graphics card for example, is directly on the motherboard as opposed to PCI. This supports the theory that the main reason for the backed up release date was related to AGP support. The model to make an appearance will probably a 68060 @ a speedy 80mhz.

In other Milan news, the DDP translation team is helping translate the bundled Milan Software in preparation of the North American release. Expect to be able to pick up an American Milan II from your favorite computer shop near the beginning of summer.

I for one am salivating at the prospect of being able to get my hands on a Milan 2 here in North America!
Everybody have a good day,
Sam Ferrer

Depending on the model of STf when booting hold down the left control key
and the system will boot with only the HD drivers only. Give this a try I know
it works with a Falcon, TT, STe, and Milan.

Steve Sweet <steve@sweet3.freeserve.co.uk> wrote:
>What is the size of your C partition, is it partitioned AHDI
compatible.
>
Yep. Strange problem. Let me relate...

Completely reformatted drive. Partitioned drive as
32/32/32/32/32/32/32/150/650 MB(I know this is a lot of
partitions, but I'm rather used to Drives C - I).

Ran Diamond Edge on the 32 Mb partitions. No problems found.

Copied over my existing 230Mb Drive onto the 1 Gb. Examined FAT
tables and the directories. No problems found.

Disconnected 230Mb drive. Connected no other drives (only the 1
Gb is there, with termination). Attempted to boot. 2 bombs.
Booted off floppy (Alt. key). Hard drive works fine on all
partitions.

Scratch head. Repeat process a few times. with same results.
No changes, then... Drive F: goes blank.

Disconnect 1Gb drive. Reassemble SCSI chain as it was before.
Get real bummed. Total time: 4 hours.

This CAN'T be a termination error, can it? Only one drive is
connected! Voltage to the external case is a possibility, as
this case has been in storage awhile. Something is messing up
the FAT, that's clear enough. Did I buy a defective drive? I'm
setting this aside for a while and going on to something more
fun.

> attribute dialog.

Hi, Daniel,

You would be correct if I were attempting to print a "picture" object. But I'm not, I'm using Pap's built-in line patterns and greyscale fill colors.

Starting with Pap 4, you can apply different dithering patterns to picture objects, but the Pap 4 manual supplements specifically states the dither patterns cannot be applied to Pap's fills.

Years ago, I did some very extensive tests of line screens and printers using Calamus. From the looks of things, the fill patterns may be optimized for 600 dpi printer output. The SLM is half of that. The output on my HP4 is great, but not worth a damn on the SLM. And still having and using Calamus, I know the SLM is capable of far, far, far better output of greyfills than I'm getting. <G>

It's a word processor rather than a text editor, so there's graphical fonts involved - I'm not sure ATM whether one can also use TTF, Speedo or PS fonts. There were loads of PD fonts made for this (and its bigger brother Signum) some years ago.

I might make the RSC file a DDP Translation project.

Depending on the CDROM driver this might not be necessary I now recall.
Spin! requires the step listed above, but Extendos doesn't. Presumably it
uses its own routines to access the SCSI bus, whereas Spin! uses HDDriver's
generic driver to do the dirty work.

>Same thing exists on my Hades. On bootup, I do not get the CD ROM drive

The answer is that the system should automatically recognise that a
cartridge has been changed, also read Uwe's answer in this thread,

I'd strongly recommend that you try swopping a few cartridges around
and make sure that they are recognised correctly before writing ANY data.

The pins closest to the front of the motherboard. Doesn't the connector you
have have any keying? It's been installed badly if it doesn't, because
you'll have to figure out which way round it goes yourself.

Attempting to download binary files (or indeed any that aren't recognised by CAB) should bring up a fileselector to choose where they should be downloaded to. Otherwise you can find stuff in your cache with the cabcache tool (from the Modules menu item) which presents the info in human-readable form.

I highly recommend Atack's aFTP client from http://www.pwp.cz/atack/

Install it in the Clients menu and tick the VAStart box.

By hardware, using the M0 and M1 pins in the video connector to code the
type of monitor connected. This isn't the answer for the bootup question,
which is a different can of worms altogether.

Hi Hallvard.

I know how valuable that FTP site list was to me when I came on the internet and was looking for Atari Software. As you can see, I have left all the copyright information intact. Erm, but I did update 1994-1999 to 1994-2000 on your behalf, hopefully you didn't mind me making that alteration. As you can see I used the words "the list" and not "My list" which is actually "your list" if anyone can follow this;-).

I think we are on the same page here. If you have any problems with my actions to your FTP site listing, feel free to mention it. I believe I discussed with you back in December of renewing the tradition for the Millenium.

I realized that when you became to involved in other activities that the ftp site list was to important not to be updated on a regular basis and posted to the NG on a regular basis.

And as you can see, already one person, has tried to follow your link, so there is a definite interest in the FTP site listing.

Brian.

Source record: 64793

Here's another problem...

Recently, I've been running more and more often into this problem, and it is frustrating as heck. I click on a URL and CAB just starts counting down its timeouts until it hits 0. Sometimes on the second try it finally links up (when it does this, it is almost immediately instead of counting down a while). But often (and more often lately) it just will not link up and get the data. This is especially frustrating when sending forms, because not only will it not try a second time, but you always have to click on OK in the transaction failed box, and try it again. Recently, it's been so bad CAB won't load in any data at all from most sites, making web browsing completely impossible and my computer (even more) worthless as an web machine.

Has anyone had this problem? More importantly, has anyone overcome this problem? I've tried playing with mtu settings with no success. I've tried disabling concurrently-running programs with no success. This happens with every CAB.OVL and both CAB 1.5 and 2.7. Any ideas? Thanks!

3239. MIDI-3 Announcement

Newsgroup: comp.sys.atari.st
Date: 2000-03-06 00:00:00 UTC
From: mb@gem.win.co.nz
Message-ID: <FqzCo2.Fy@gem.win.co.nz>
Source record: 64795

ANNOUNCING THE RELEASE OF MIDI-3

MIDI-3 is a 3 MIDI output expander which attaches to the serial (modem) port of an Atari ST computer. When used in conjunction with MIDI sequencer programs such as Notator and Cubase, MIDI-3 provides 3 extra independently addressable MIDI outputs in addition to the Atari ST's standard MIDI output.

MIDI-3 is fully compatible with the original C-LAB EXPORT expander (no longer available), and works with any software that supports EXPORT.

SUMMARY OF FEATURES

* Provides 3 extra MIDI outputs on Atari ST or compable computers.
* Attaches to the serial (or modem) port.
* Fully compatible with EXPORT.
* "Plug and play" installation.
* No external power supplies or other connections are required.
* Available in cased (external) and uncased (internal) configurations.
* Very compact dimensions.

PRICING AND AVAILABILITY

MIDI-3 is available immediately in cased and uncased configurations. The cased configuration is suitable for external connection to a computer, while the uncased configuration would be useful for mounting inside a recased Atari ST.

Pricing for the MIDI-3 in New Zealand Dollars is as follows:

MIDI-3 cased: 110 NZD (40 GBP, 60 USD)
MIDI-3 uncased: 100 NZD (35 GBP, 50 USD)

Figures in Great Britan Pounds and United States Dollars are approximate and for reference only.

Quantity discounts are available in quantities starting at 5 units.

>my synth. Thanks...

You can always record the sysEx data as a MIDI track in a sequencer -
providing your sequencer supports this. I know Cubase and CAF do. I often
save my sound module's sysEx data right with the song - which makes things a
lot easier if I revisit that song several months later.
:^)

Not sure about MagiC 6 since I'm still using MagiC 5, but in MagiC 5, go to the OPTIONS menu, then CHANGE RESOLUTIONS and select the resolution you want (ie. 256 colors), then click on [SAVE]. This will become your default bootup resolution next time you boot.

Note: if you click on [OK] after this, the computer will switch to that resolution right away (although this step isn't required to get it to remember this setting for the next boot).

Oh yeah, and don't forget to SAVE OPTIONS after this (to save the new setting in your MAGX.INF file).

I am a Cubase kind of guy myself, but I also like to use alternate applications that can do things Cubase can't. Even though Cubase has the IPS module, which is very "M" like, M is a differnt story. My usual setup is to have my 520ST or 1040Ste run the "alt-App while I record the whole session in Cubase on my TT.Apps like Tunesmith can send midi clock, so I can have Cubse set for external midi sync.So then everything can be on-Time.

Check out my Cubase page as well, I have some usefull downloads. I am still learning however, and would even like some "new" tips!

|It's a word processor rather than a text editor, so there's graphical fonts
|involved - I'm not sure ATM whether one can also use TTF, Speedo or PS
|fonts. There were loads of PD fonts made for this (and its bigger brother
|Signum) some years ago.
|
|I might make the RSC file a DDP Translation project.

Which version is it? Version 1 was available in the UK and worked
with UK keyboards but did't like resolutions higher than ST High.
Version 2 worked OK with higher resolutions but was not released in
the UK and I had to hack the German program and the fonts to get
everything to work. It was a lot faster than Papyrus but not as
flexible.

I read that there was a newer version ?3 - does this work with UK
setups?

You need to create a boot.sys file. I use ICDBOOT.SYS created with the ICD
Utilities program. After creating this file it needs to be placed on the hard
drive, C:

A utilites disk originally came with the ST4 which should have the Atari
Utilities programs to create the system.sys file.

You may also want a program, SCSIWait which will allow you to turn everything
on at the same time. Without SCSI Wait, you'll need to turn the hard drive on
and wait till its up to speed, 20 seconds or so.

Oh yes the Milan was there BUT it was still the same *prototype* as showed
november last year in Hannover (Germany). According to the French salesman
the Milan II will be ready for the public somewhere in september (he
didn't mentioned the year though). I forgot to ask him about the graphic
card but the leafled I got from him mention a "PCI ATI Mach 64 4-16 MB
card". Still according to him the Milan II will come with full Atari
compatible MIDI.

I doubt NoSTalgia handles Mac Midi ports. Besides, the timing will probably
be all screwed up.

3270. Anyone have these problems?

Newsgroup: comp.sys.atari.st
Date: 2000-03-07 00:00:00 UTC
From: nameerf@flash.net
Message-ID: <JZdx4.84$624.8331@news.flash.net>
Source record: 64716

Problem #1:

This hasn't been much of a problem until recently, but under
with STiNG, CAB 2.7, and any CAB.OVL, I can't seem to get CAB to link
up to receive data at a lot of sites. I've found that sites that have
worked in the past no longer do. What happens is, I click on a link
or enter a URL, and CAB simply times out on "Waiting for data", no
matter how long I have the timeout set for. It then displays "Error -
File Not Found" or similar. I can *sometimes* hit reload and the page
is loaded immediately with almost no timeout count down. But usually,
it just times out again. I normally have to hit reload 3 or 4 times
before I can get to the next page. And then images won't load for the
same reason (especially frustrating on pages where they don't give
alternate text for images that serve as links). I've tried changing
MTU, MSS, RWIN, etc. settings, and the problem still persists, only
the download speed changes for pages that come in fine. Some pages I
have no trouble at all with this. And on some, the first page or two
comes in fine, but the rest don't.

Problem #2:

CAB.OVL 1.40 has solved a bunch of problems (specifically
ones relating to my University web site, which Dan has helped out
with personally - thanks a ton, Dan!). However, new ones have crept
in: I keep getting "Connection dropped by peer" in the status bar
when downloading info (both pages and images). Often this causes CAB
to crash completely. Has anyone else had this problem? It happens
quite a lot.

These problems are making web browsing impossible, as I am
limited to only a few sites. If anyone can help, it would be much
appreciated! Thanks!

No it's not that, the default I keep on is *.* If I switch to another
newsgroup folder those .txt files come up fine. I even tried different
resolutions out of curiosity, needless to say it made no difference.

I'll keep experimenting and see if there is a set pattern/situation which
causes it to happen.

Hi there all you Atarians

I'm a newcomer to the newsgroup scene and have just discovered y'all.

As you are all so experienced please give me some help.

I have a Mega 2 ST, SM124 and Gasteiner (Seagate) 1GIG external hard drive
plus SLM804, never used.
I have a lot of ST software.

I would like to get the ST software working on my PC. Are there any step by
step instructions as I understand that there are emulators that will work on
my PC (it's a P2 400 mhz with 128 MB ram, 8.5 GIG hard drive).

I would also like to know how to get an internal disk drive for my ST-I
think mine may have died.

Can I find a list of good Atari Sites anywhere for info?

I guess my timing was not all that bad in getting my Milan040 now. Yeah it's not a 68060 @80mhz and the software is not in English but I have one now. My next order of business with the unit since I haev it working properly now is to get it networked to my home network for some serious high speed Internet Surfing!

For a decent freeware emulator try Gemulator at www.emulators.com also the shareware TOSBOX is very good but I do not have the URL to that site. Try your favorite search engine and you should find it. For comercial apps I enjoy MagiCPC.

It's not a special cable as such. Go to your local computer store or
computer fair and buy a 25 pin to 25 pin cable. Just check that you can
open one of the plugs, some are moulded. Get it home, open the plug, snip
two wires and solder them the other way round as directed in the
instructions, close the plug up, label the cable so you know what it's for,

job done.

it'll be interesting to see what is coming, though - according to our
TAF president, one of our members is beta-testing a new version of
Papyrus Office that is supposed to be killer.

Smurf has something wrong with it? When I was at Joe Conner's place
two years ago and he showed me the translation in progress, it really
blew me away just how powerful it was.

> Falcon at 640X480X256.

Now that - THAT is impressive. :) This is the type of ammo that
should be launched at TiFKAS to counter his FUD.

As someone else has said here, for the Milan II
> to succeed in todays world, we have to have a better browser than CAB
> and for acceptable backwards Falcon/ST compatibility we have to have
> DSP and Midi cards. I hear that these are 'being developed'. I pray that
> this is not 'vapour ware'.

well, the DSP card (and a TV card) are being developed by Woller,
they've confirmed it - and when was the last time Woller announced a
vapour product? :) Plus, aren't there supposed to be people out there
who found that the Star card- the one designed for the Hades to work
with Cubase Audio - also works with Milan?

MIDI can be handled by USB, it'd just be a matter of writing an
appropriate USB driver to use with some of the existing USB to MIDI
devices out there, like the one from Roland. Shouldn't be hard to do, as
TiFKAS claims that even the grandmother of an HP employee can write a
USB driver :)

hmm, that's interesting. TiFKAS crows over and over that Netscape is
perfect and has "no flaws", and yet it can't do something that simple?

Hi Caroline, or is it Paul??

If you ever intend going to Abergavenny, and you would like to see a
Milan (and a Falcon) in all its glory, give me a yell, either here or at

rking@zetnet.co.uk.

We Atarians/Anglo Welshians must keep together, there aren't many of us
left!!!!!

Bob King.

>for them?

Sorry Peter. :-)
Are we talking within CAB or something else Peter? Within CAB it's
just a case of when the file selector appears specify a directory ie.
D:\Download\ and save the file. Before shutting down save the CAB
settings and the next time you CAB downloads a file the file selector
will open at that directory. I'm sure you must mean something else but
would need to know what application you're using.

Hi Bob,Paul and Caroline

..snip.. > Abergavenny,< It was known by a different name in my Army days :))

>We Atarians/Anglo Welshians must keep together, there aren't many of us left!!!!!

There`s quite a few really Bob. Theres a very big BBS (THE DRUID) up North with an excellent supply of Files etc. Down in the South there is Steve Stupple with his LAST PDL (he bought up some well known PDL`s) he also runs a "Swop Shop" and may have that missing part you want.He also has many new progs as well. There are many users of the ATARI (and exes as well) including a compilation group in BARGOED and an ex STOS man in Dinas Powys.

So Caroline if you want help to remain and use anything ATARI there is help around "The Land of YOUR Fathers" :)) Please dont expect us all to use the Mother tongue though.

Derek

>success. I've tried disabling concurrently-running programs with no
>success. This happens with every CAB.OVL and both CAB 1.5 and 2.7.
>Any ideas? Thanks!

Whenever CAB seems to be doing nothing like you mention, a simple tap on the ESC key usually gets it going again. Or if it does this when you've just clicked a link on an already open page, you can just "re-click" the link (which is equivalent to clicking STOP and then clicking the link again). Unfortunately, this _won't work_ when you're trying to send data in a form - you'll get the "transaction failed" box. But it works great when you're just 'pulling in pages'.

And of course, adjustments can be made to your STinG settings as well, although the timeout problem doesn't seem to be affected by them much in my experiences.

This is V5, and (as I said) is to be found on the recent STComputer CD. I
don't know how non-subscribers can get hold of it, perhaps someone can tell
us what its "spreadability" is?

>I read that there was a newer version ?3 - does this work with UK setups?

This one seems perfectly content here, CT2 Falcon in 800*600*16 colours
under MagiC6 and NVDI5. The "Date" function reports the year as 19100
tho'...

Otherwise, a fairly simple WP - something similar to Wordpad for Windows I
guess.

Sorry if this posted twice!

Hi All,
Running Cab 2.7, NVDI 5.1, latest StinG/Dialer and associated files,
HSMODEM&, either of the latest OVLs by Dan or Oliver on a Falcon MKI (14 meg).
Crashes occur if I move the mouse curser to fast off the 'YES' button in the
dialer after selecting 'disconnect'! The system then takes it's time
clearing in trying to disconnect again but does disconnect without having to
reset.
CAB crashes are occurring similarly when clicking on the 'Stop'
downloading button!
Any thoughts?
John G.

>
Mike - I can go to the sub-directories such as Arts/Sciences/Sports etc without any problem. What I can't get to work (causes an error 69 with CAB and bombs) are the services such as shopping/yellow pages. Went to the Canadian Yahoo site and everything works fine, so go figure. I am using CAB 2.7 with Dan's CAB OVL 1.4. I did notice that I saw a strange heading in the address for the services - this may be the source of the problem, at least for those.

What OVL are you using?

Steve Hammond

Mike - I get that quite a bit with my 350 MHz PC/Windows 98 combination :) - have seldom seen it with the latest Sting modules/CAB and Dans OVL. Question - What versions of the STinG STX's are you using and Sting itself?

Understood. My point was that I didn't want anything that was _slower_ than
the Falcon (as far as potential throughput is concerned should I decide to
utilize the card on a faster computer in the future).

Thanks for your information though Uwe. Always informative.

Hi Steve,

(red faced Mike says) actually I was trying to get to the personals:)
I am using OVL 1.4 and CAB 2.7c. I'll try the Canadian site in a bit.

Thanks,
Mike

Hi all,

Just like Indiana Jones, 'I have a bad feeling about this' Milan II thing. Surely we were promised a substantive appearance if not quite a launch of the new 'Super Atari' at the Silicium Expo. and it looks like Bengy was also lead to believe so. It is pointless, patronizing and childish to spin the punters a tale just to keep them happy and quiescent. We atarians are in a minority - almost - hobbyers position, but at least a good proportion of us are long enough in the tooth and have been long enough loyal to the atari name to expect to be treated like adults. Let's have the truth in future, we really can take it!!!

On a lighter note, have any of you been following the battle between a certain self professed 'Power Mac User' and pro-atarians on 'comp.sys.atari.advocacy'. The promised imminent arrival of the Milan II had been grasped by more than one as a weapon against the foe. I just hope he does not learn about the latest fiasco. If he does, then you will hear his crowing from Canada all the way to Germany and all our side will be able to do is wimper.

Bob King.

well, TiFKAS has been doing his best to try to stop the Milan II,
spreading all kinds of FUD about it from the beginning - including
claiming, before the first Milan was released, that "90% of all TOS
applications fall over on the Milan"; that "there is a high failure rate
of Milan 040s" (just based on a message here from Matthias Jaap, that
Matthias later confronted him about in .advocacy) - and, of course, he's
using his typical nonsensical FUD about the "inferior" 680x0 technology
(which, of course, means he thinks that all 680x0 Macs are junk as well).

If he gives you a hard time about the Milan II being late, just
remind him that Steve Jobs promised the G4 500MHz Tower would be
shipping "in a few weeks" on August 31st, 1999 - and only finally showed
up in February 2000, only to be crushed by 1 GHz Athlons a few weeks
later. Those must've been some pretty long weeks :)

Don't worry about it - we have plenty of ammunition against the
little flatulence. Especially the problems Apple is having with iBooks
that have self-destructing hard disk partitions, iBooks with cracking
cases, the fact that the new Appleworks 6 is now being called
"Appleworks Sux" by users because of many flaws (one big problem - they
removed the ability to import Microsoft text files! How STUPID can one
get!), that Half-Life and Pharoah were cancelled for the Mac because of
poor sales of similar products, that there are reports that UnReal and
Quake 3 Arena for the Mac are suffering very poor sales...

Oh, yeah, and you'll get a big laugh about TiFKAS' banging his brains
out about how the Mac is the "superior" MIDI platform - especially ask
him about the "updated MIDI Software" from Adobe (yes, ADOBE) he
supposedly saw at a major Mac show. Needless to say, the MIDI
professionals who use Atari have him roasting over a spit :)

followups set to atari.advocacy......

Hi Daniel,

I didn't want to identify any of 'our side' in the 'war', but you have 'outed'. I did intend to send you a mild warning about extolling the software bundle promised with the Milan II. If it's anything like that supplied with the Milan 40, then it's not very impressive on close inspection. As you know you get a start up disc and a CD. There are no manuals for any of the programs on the CD and for the Milan 40, the computer manual itself was in German. Excepting for the OS needed programs and Thing/Ming, the programs are of the 'Lite' type, eg Papyrus, ie severely limited or substantially U/S eg SMURF and Draconis. I know the practice of CD versions only of programs is normal with the PC, with the tease of paying for the Manuals, but that does not apply here. The let down with the bundled software is a pity, since the Milan is a superb graphics machine. The only PCI card supplied in the basic M/C is a dedicated graphics one, but this alone has allowed me to use DA's Layout TC and PhotoLine at 800x600xTC at speeds up to 10 times the Falcon at 640X480X256. As someone else has said here, for the Milan II to succeed in todays world, we have to have a better browser than CAB and for acceptable backwards Falcon/ST compatibility we have to have DSP and Midi cards. I hear that these are 'being developed'. I pray that this is not 'vapour ware'.

All the best in the war.

PS. re this follow up, Netscape refuses to reply to the groups you have set up, so am replying to comp.sys.atari.st

Bob King.

http://www.umich.edu/~archives/atari/

There is also a site called SUPPORT SHAREWARE AUTHORS.

There are some amazing games on this site.

I don't have the URL handy.

You might find a link from the Atari Launchpad.

http://launchpad.atari.org

Assuming the org server is working reliably:-).

Also check the Ftp site list found in the Launchpad as well as I think
their is a link from the Quick FAQ pages.

Finally, their should be a very recent listing on this NG, called FTP
SITE LIST in the Subject header.

Later Brian.

3326. Falcon in a PC tower case

Is this easy to do?

I may be able to get a cheap/free Falcon with a dead PSU and parallel port soon. Is it reasonably straightforwards to fit one into a PC case?

Yes, I realise it may involve soldering! ;)

Hi Derek,
yep I know about the Druid, used to be a regular user in my
pre-internet days and yep I know Steve or at least we have exchanged
goodies and cash. The only other 'official' name for Abergavenny is 'y
fenni', indicating its proximity to the river Fenni, a small stream
actually, but perhaps it has shrunk with time!! Don't we all!!
Talking about the passage of time, 'In my army days'? if you are talking
about conscription, that makes you a wrinkly like me, I only 'escaped'
by going to University, though I wonder now if a bit of military
discipline would not have done me good!!!

3330. Logic makes AVHF

Newsgroup: comp.sys.atari.st
Date: 2000-03-09 00:00:00 UTC

Have just received EMAGIC Logic 2 and wow you should see the packaging, let alone the software. A gray ABS 10"x12"x2.5" book like casing, with a note extolling the use of recycable ABS as against others card board. The two manuals are a revolation in this A5 Magic/NVDI booklet day, filled with detailed screen dumps (all Mac, but the book says that the Atari is substantially the same) and over 400 pages in total. There is also the Midi extension and Dongle box. I thought that such packaging was only for the PC etc. All I need now is a couple of years to learn how to use the thing. Oh and by the way, all for ï¿½50 care of Loot.

Bob King (AVHF (A Very Happy Fella))

Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.mac.advocacy

Itinerary for the March 15th. 2000 meeting of the Toronto Atari Federation....

Are you the proud owner of an Apple iMac, PowerBook, iBook, G3/G4 Tower or older PowerPC computer? Do you miss playing your old Atari ST games, or is there an application out there from your ST days that you just can't find a replacement for? Want to amaze your other Mac buddies? Have you wondered about what all this fuss is about emulating older platforms on newer machines?

Well, tonight's meeting may have the answers to these and other questions you may have - for we'll be demonstrating the Atari ST emulator NoSTalgia. An amazing feat of programming, NoSTalgia allows you to run a wide variety of Atari software - including MIDI software - on your Macintosh. We'll also be touching on other Mac emulators, including MagiCMac.

Yes, tonight will be an informative and fun night of demonstrations not only for Atari users, but for Mac users as well. Be sure to make time for this interesting seminar!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

Ken MacDonald, president: anarkist@idirect.com, 416-533-0504
Dan Dreibelbis, Vice-President: dreibel@idirect.com 416-766-4743

Did you know you can email money with PayPal.com?

PayPal.com is a completely free service that lets users send money to anyone with an email address. Use PayPal.com to settle restaurant tabs with colleagues, pay friends for movie tickets, or buy a baseball card at an online auction - all with the click of a mouse! PayPal charges the money to an existing credit card or bank account. It's faster, safer and easier than mailing a personal check.

As soon as you sign up and register your credit card, PayPal will automatically send you $10! I recently signed up for PayPal and got my $10 bonus right away.

Signing up is quick, easy and you can download the money to your bank account at any time. No strings attached. Click on this link to sign up and see for yourself:

https://secure.paypal.com/refer/pal=csjjh%40eiu.edu

REFER YOUR FRIENDS AND EARN UP TO $1,000
After you sign up, you'll get an mail like this to send to friends and family, and PayPal.com will give you $10 for each friend or family member (up to 100) that signs up and registers a credit card. It's that easy!

3334. New Game for Falcon, Milan and Stemulator Gold: Enemywar II

A short note just to say thank you to all on this group. :)

I downloaded the above file, but when my friend tried it, no luck.
Is there a difference between Notator & Notator SL dongles ?

>for them?

If you did not chose a drive and folder when you got the file selector shown (under Binary File warning), then you need to search through your \Cab\CACHE\a\ & b\ & c\ etc folders looking for files ending with ZIP or .LZH (or .TOS) and copy them out to another folder where you can deal with them with 2in1 or similar unpacker. Unfortunately, CAB has no option to chose this path separately from Cache.

Charles.

You can download the older v2.x which was distributed via disk
magazines years ago, but there is no real compiler for it.
All newer versions are commercial as Mike states.
Check out my gfa pages for further info on gfa.

Hi John

I too, have this problem with NEWsie but only on my Falcon, and not on my ST. As I run NEWsie off the Syquest, I have always thought it was a SCSI problem. So, I hit escape as you do and carry on. Like I mentioned, I haven't had this happen on my ST. And well my TT is running ASH 2.0 at present.

Later Brian.

I did some tests with Pap 4 and an HP laserjet II (300 x 300), and
with my Canon BJC-210 (360 x 360) and both did a fine job printing
some greyscale patterns. Maybe the problem resides on the driver. Are
you using pap's own drivers or GDOS/NVDI?

Greetings

Daniel

Hi all,

Well, I guess my Falcon is "special" ;-). I'm running Newsie on
a 14meg Falcon w/Nemesis, ICD, Warp9 - and I very rarely have
that happen. I run a pretty minimal setup. Maybe there is a
conflict with one of your accessories, etc. I dunno.

Hi Bob, good going. I think Logic is a fine program. Version 2.5
is a nice step up from 2.0. Did you get 2 or 2.5? Version 2.01
(both Logic and Logic Audio) are available off the web free, but
you have to have the dongle. Yeah, the box is.... interesting.
I'm still looking for a suitable use for it. It's too... unusual
to throw away. Let me know if I can help any. My MAIN sequencer
is still Hybrid Arts EditTrack. I learned on that one, and it's
quick and efficient to get around on. Doesn't have notation, and
a lot of other stuff in Logic, tho.

Given that quite a few people have put STs into PC cases I'd say the answer
is a resounding YES. Not sure how you'd deal with issues like extending the
ports tho'. I'd suggest fixing that parallel port if you know what the
problem is (fried chip?)

Hallo Liam!

LP>Is it reasonably straightforwards to fit one into a PC case?

Well, if you manage to find a case with the PSU fitted near the top of it.
Otherwise, there won't be enough space for the Falcon Mainboard.

LP>Yes, I realise it may involve soldering! ;ï¿½)

Oh, rather few soldering, just the reset button and some wire for the keyboard.
But you'll have to do some constructing on the case itself, i.e. make some
holes in the back to fit the connectors of the Falcon's mainboard, which is not
at all PC-compatible. I've done it myself some years ago, but I'm mechanical
engineer, too :-)

Go to file.. Modules.. CABcache option, that blokey will help you find
them.

Ive got a PRG thats called SDCAB that will pop up a fileselector after a
CAB download prompting for a Human readable filename and destination, alows
you to copy or move from cache to ?:\xxx\xx.

> Yes, I realise it may involve soldering! ;)

it should be very possible to do - AAMOF, a couple of guys at one of our meetings brought in a Falcon they had recased in a PC Tower that was quite impressive!

Indeed, thanks to both Chris Crosskey and Mario Becroft, you can now get all sorts of widgets that will make it a snap to attach certain types of things to that motherboard, including the PC power supply.

A couple of things, though -

- you'll need a full-size tower case to accomodate the motherboard, as even a mid-tower has not enough room to accomodate the motherboard length.

- also make sure that you have an AT form factor case, NOT an ATX case. The power supplies are different in these cases, and an ATX could fry the Falcon board even worse.

How about Mario Beacroft's IDE interface, which will fit STE ot STfm
with a 2.5" dirive inside a standard case. There's also other projects
he does.

Thanks, that's helpful.

Rough idea of cost? I can provide the case.

I saw a Falcon/030 in a shop today for UK£300, by way of comparison...

Message-ID: <LV0y4.4810$qa.217737@newsread1.prod.itd.earthlink.net>
Source record: 64557

This problem is the main reason i no longer use my falcon for browsing.
It's bad enough CAB takes forever to render pages, but to wait and have to
keep clicking a link and hitting esc is a little "interactive" than i wish
it to be.

Funny though that cab 1.5 and older versions of sting and the ovl do not
have this problem.

Hi Clayton,

Most of the time, Newsie is blazing. That is why I mention the slow server thing. Esc gets it going. I still run Sting 1.15 and to be honest just been to cautious to upgrade a working system:). My setup just seems to be sensitive to long periods between transmits when the server is slow to respond. When a newserver is hot, downloading large binaries is a breeze.

I just set my timeout to 7 seconds. If it don't start to load by then,
I don't need to see it:) It almost seems sometimes that often the skipped
information doesn't really make any difference in what is loaded into
CAB, other times it is noticable.

Thanks for all the fedback! I don't think this is a 'slow' server problem

but there might be a missing or mis-read EOF from the server by Newsie.
I'ts been happening more often as time goes on and your responses lead me to
believe there's a compatability problem. I also neglected to mention I'm
running a stock Falcon MKI (14 meg), NVDI and latest Sting/Dialer stuff.

>> you have to have the dongle. Yeah,
>
>can you let us know where? a later version might work better than the one I
>have

Well OK, but this is the last time!! Unless someone asks AGAIN.
;-) It's an ftp site. If you're using a PC or Mac program
(boo-hiss!), you may have a problem getting there because it
doesn't start with "ftp". Someone reported success with a program
called "Bulletproof Ftp" (I think). But with Atari and Newsie
(yippee), you'll not have any problems.

dir.mcc.ac.uk/pub/emagic/LOGIC/UPDATES/ATARI

IIRC, these files are just the program only, and you have to have
the other files (fonts,drivers,etc.), which you'd already have
anyway if you have the dongle. Also, there are two versions of
each file. One is compressed, the other not.

Hope that helps,

Clayton Murray

Although still shareware you don't need a key anymore.

The Belgian ftp-site doesn't hold the English version (yet)
A good alternative is boxkite. It supports long filenames, MagiC
fileselector calls, etc.
I'm using Freedom 2.05 myself but I know for sure that some will have
serious problems with Freedom. It does some dirty tricks to achieve its
goal.

ftp://chapelie.rma.ac.be/atari

utilities/file_selectors:
total 1032
-rw-rw-r-- 1 ftp 111784 May 5 1999 bkit213e.zip
-rw-rw-r-- 1 ftp 129390 May 5 1999 bkite203.zip (English version)
-rw-rw-r-- 1 ftp 382898 May 5 1999 frdm205d.zip
-rw-rw-r-- 1 ftp 380785 May 5 1999 fredm204.zip
-rw-rw-r-- 1 ftp 23925 May 5 1999 uis332r1.lzh

'uis' Ultimate Item Selector is also a nice fileselector but it doesn't
support long filenames.

Hi there!

Haven't been around for a few days. Well back in action again ;-)

On 8 Mar 2000 21:37:14 G, Steve Sweet wrote:
> >getting rather fed up with the NVDI |5/Pap 5 bug... ;-)
>
> And what bug is that??.

It's actually mentioned in the NVDI 5 manual (FAQ pg22)
"Q. In Papyrus, the layout and positio of object is wrong. Why is this?
A. Your version of Papyrus has an error in the resolution inquiry, which is
fixed in Papyrus 6"

If you try designing complex documents with frames/graphics more than likely
the layout will be all wrong, especially with right-aligned objects. I
contacted System Solutions when I upgraded to NVDI, but they said that Pap 6
was no longer available. I have been waiting since then (now almost a year) for
a new version of papyrus.......... :-(Hopefully some day soon.. keeping
fingers crossed!

Funnily enough, this problem does not appear with Speedo GDOS (I used to use
5.0c) or with earler NVDI versions. A Papyrus bug, or just people changing the
"standards" ;-)

Cheers,

Jerry

Hi Liam
A Big Tower is nothing but a a large tower case : you have mini-midi Big , ATX etc....
You just have to buy the biggest you can get !
Then you remove the PSU , then you have to remove the metal around the PSU and turn this unit
upside down.You can still keep the plate with the AC connectors ! The methal shielding around
the PSU is not needed !! It seems difficult but you can do this within half an hour !
Then you have to cut off a piece of the metal box, where the 5,25 inch slots for the CDROM, diskdrive
writer etc. have to be installed.Cut it till you can still install three units AT THE TOP !!
After that it's just a matter of dismantle your Falcon , throw away the PSU of the Falcon or keep it
And place the motherboard in the tower .It will fit !!
Then make it simple and feed the printer, modem, monitor, mouse cables simply through the slots
at the back of the tower .Ready !!!
When you want to hear more, just give me a personal email !
Then I can even send you JPG's of my tower , no problem !!
Jos

Got through OK...First time I've ever been the topic of the article ;-)
certainly got my attention :-)

> Yes, I'm using CAB (2.7). The problem is that with the pages I visited
>the fileselector didn't appear. I visited Uwe Seimet's page and clicked
>on some links to his freeware programs and demos, and they downloaded
>straight into the cache folders - with no apparent rhyme or reason as
>to which ones. I hunted through all for archived files and found them,
>extracted them and all was OK. I was looking for an easier way.

I too use 2.7 and if I'm actually downloading files - say from Uwe's
site - the file selector is called once the file download is complete
and I can choose where and what I want to call it. What setting do you
have in the CAB viewers option for binary files? I have what was setup
when I bought it: *.hqx,bin,uue I don't know if changing this would make
you lose the file selector?

>I now understand that Cache Tool will solve my location problem (I hope!).

As Steve says, this is a good way to trace your files but another method
I use to do this is (if it's an important site like say MagiC online
etc) I go to the page online and if there are pages I want to read
(for example the interviews with atari authors) I save the main MagiC
home page in my "Hotlist" then click on to the various interview pages
I want to read - but *don't* actually read them. Once I have all the pages
required in my cache I can then go offline. Then I can go to MagiC
page stored in the hotlist, and click the exact same link sequence again -
CAB will say something like error-1 but will then reload the page from the
cache which you can then read without paying BT even more of your hard
earned cash! :-) Incidently this works to find downloaded files too.

Good luck
Sean

3387. TCP/IP on a Milan?

Newsgroup: comp.sys.atari.st
Date: 2000-03-11 00:00:00 UTC
From: Fred Horvat <fmh@oh.verio.com>
Message-ID: <38CAC6A8.41774287@oh.verio.com>
Source record: 64503

Hello,

I just purchased a Milan040 with the recommended PCI Ethernet card. How do I setup the machine up to participate on my TCP/IP network at home? The Ethernet card is recognized when I boot because it states that there is a PCI card in slot 4 with an IRQ of 11. What software or settings do I need to make to assign the machine an IP address and subnet mask? By the way I am using the Milan MultiOS of Mint 1.15 and N.AES 1.2 that came installed on the machine. I have not installed MagiCMilan yet but I would like TCP/IP to work with MagiC also if possible. Thanks.

I visit THE DRUID BBS daily not always something new there but Peter
does also get some obscure newsgroups for me,ie Dog newsgroups etc.
He also gets very up-to-date uploads and sometimes quicket than
searching the Internet Links.

>The only other 'official' name for Abergavenny is 'y
fenni', indicating its proximity to the river Fenni, a small stream
actually, but perhaps it has shrunk with time!!

Who said anything about "Official" names ? I`m refering to Army
slang of "Aber-snatch" !!!

>Talking about the passage of time, 'In my army days'? if you are talking
>about conscription, that makes you a wrinkly like me, I only 'escaped'
>by going to University, though I wonder now if a bit of military
>discipline would not have done me good!!!

I was already serving when conscription started;if you are
referring to the 2/3 year stint;I was one of the "screaming skulls"
that the "boyo`s" used to write home about. A lot of the lads from
the "Valleys" couldn`t even speak English when they came in but
most went home having had a pretty good Education and restart to
their lives.Some of course we left behind in places like Korea etc.

Incidently there is still a little ATARI Wrinkly info available
from Roy Goldings AWC site.

3391. HDDriver & Syjet HELP

Newsgroup: comp.sys.atari.st
Date: 2000-03-11 00:00:00 UTC
From: Schoengarth <dons@qnet.com>
Message-ID: <38CAD565.9CE3EA6@qnet.com>
Source record: 64507

I sent my Syquest Syjet (1.5gb) over to a friends house that owns HDDriver 7.xx and we got it to reconize the Syjet but, it wont partition the drive. I beleive he is using bigdos also. It wont even allow a icon to be made for the Syjet. It seemed to be accessing the drive when we told it to partition,sector test and format. Even after all of that nothing.

Does he need to upgrade his HDDriver to a newer version? Does anyone have any suggestions on how to get this drive to work with HDDriver. I would like to be able to use the drive on my pc and my TT. The pc is set up with no problem but,I think were missing a set on the freinds TT to get the drive working correctly to swap files between the TT and a pc.

After it is all setup I want to use the Atari TT to read Atari 8 bit disks and transfer them to the Syjet. Then from the Syjet to the PC.

Any help would be greatly appreciated.

Thanks Don

Works fine with IE...

The problem is that you haven't given a complete URL so if you type it in to a browser as supplied it defaults to trying via http, which doesn't work. Also you need a trailing / to show it's a directory (again, most browsers will try to make the best of an incomplete URL, but as ftp directories tend not to have a default page such as index.html it doesn't work. And unfortunately an increasing number of people don't know how to enter a proper URL for non-web resources. The URL is really:

ftp://dir.mcc.ac.uk/pub/emagic/LOGIC/UPDATES/ATARI/

If quoted fully like this, many mail/news programs will recognise it as a proper URL and turn it into a hotlink, too.

I don't think so, ask him to clean the dongle contacts with a pencil rubber
/ eraser
if this fails I can mail you the 3.1 version which of course needs the
dongle, Is he sure his disk drive is ok?

>
>It really is too bad that pre-payment is more or less a rule when it comes
>to purchasing Atari hardware.

It's not bad if the customer can be assured that either the goods
will come, or the money will be returned. Unfortunately with
Titan/Cortex/blah... it seems to be take the money and keep it
regardless. Great way to do business. I personally know people who
have lost money due to David's dishonesty, and many others will
tell the same..

>Of course, with such a small market it isn't easy for a company to front
>the money for a production run without some down-payments.

Of course it isn't. BUT if there are not enough payments to fund
manufacture, isn't it reasonable to expect your money back????
There's even one guy who is foolish enough to say he wants the
product (when the only people who can say they have one and it
works is the developers and maybe two ordinary customers), not his
money back. Well, if he's lucky he'll get the product, but he can
definitely forget about the money. Doesn't it sound alarm bells
when you pay for something and it isn't delivered for ages and you
can't even get answers or replies from the supplier?? Totally foolish.

>>Now you learnt your lesson hopefully.
>
>I don't have a lesson to learn here since I got one of the first
>prototype Eclipse boards, for obvious reasons.

Yes, quite obvious, but I meant those who paid for it before
any solid evidence that the product would ever reach commercial
production....

>I really hope things will be cleared up for Jo Even and the others.

So do I because nobody deserves to be ripped off like that.

>>>> but the general distribution still seems to be held up for some reason.
>>Never mind distribution, they most likely just haven't got the goods.
>
>Noone in their right mind would order production of _two_ boards, so

>you can be pretty certain there are more. I don't have any figures, though.

So why are people still waiting? The money has been paid, in some
cases many months ago.

>IIRC, the two boards I know about were both installed internally, by
>David, so there was no need for external boxes (which I believe is the
>major extra work needed).

It's a simple plastic box which needs some holes cut. Nothing more.
A school kid could do this job in 30 minutes or less.

Layout,
>>Apex/upgrades..... All coincidental????
>....
>
>We've all heard the stories, but very few of them (AFAICR) have been
>from the people who actually (supposedly) had these problems.

That's not the point..... is it all co-incidental?? Why should so
many different people report similar findings??? Who has time to waste
inventing nasty stories like that?? We just want to get on with life.
How many people here
got their fingers burnt with the above mentioned products??

>I know from personal experience (with a certain German company, no
>longer in business) how two parties can have very different ideas about
>a transaction. About a year after paying for, and receiving, a Falcon
>tower case, I got a letter threatening legal action unless I paid what
>they claimed was missing from my first bank transfer

Hold on..... What I am talking about is very clear cut cases where
money has been paid, and nothing has been delivered. In one case,
the poor guy was even told that, yes, the money had been taken,
but by TITAN(!) and not by David personally(!!), and since TITAN is no
longer existing..... there is no more contract!!!! Legally, perhaps,
I'm no expert in that area, but morally???? I don't know that guy
personally, but who would invent such a feeble story anyway???

It stinks.#

>Still, I'm not saying that all is or will be well with Cortex.
>I really don't know at all what's going on lately, and it worries me too
>(though not for financial reasons).

Nothing's new about David Encill's way of conducting business.....

There was no manual to speak of. Only a small supplement to the
the ST manual that showed how to the remove the trackbal for
cleaning and such.

I don't know about Newsie but Everest, at least the version I've (3.6Eï¿½,
23.1.1999), can handle LFN perfectly well. And so does Luna and Qed.

What kind of problems do you have?

>settings and the next time you CAB downloads a file the file selector
>will open at that directory. I'm sure you must mean something else but
>would need to know what application you're using.

Yes, I'm using CAB (2.7). The problem is that with the pages I visited
the fileselector didn't appear. I visited Uwe Seimet's page and clicked
on some links to his freeware programs and demos, and they downloaded
straight into the cache folders - with no apparent rhyme or reason as
to which ones. I hunted through all for archived files and found them,
extracted them and all was OK. I was looking for an easier way.

I now understand that Cache Tool will solve my location problem (I
hope!).

Regards, /Peter/

>

It seems that it is not possible... changin the resolution simply
changes the rez once magic has booted and initialised everything. Not
it's boot up display rez.

would be interested to know what a ST boots up like with a colour
monitor however

oh well!

thanks for all the posts..

>>whole system.
>
>For the most part you are correct. I am have found for some strange
>reason that LDW Power likes the B5 accessary. I get a BUS error when
>using B4. Strange......

Strange it is because the copy of LDW Power I've (v 2.0) seems to work
without problems with B4. As I don't know how to use LDW Power I haven't
played very much with it. I could load some examples (with drag & drop)
without any hasle. LDW Power works even with 'copy back' enabled.
It also can be used from an 'ext2' partition or a MiNT VFAT partition but
LDW Power doesn't like long file names at all.

if TiFKAS shows up, we'll set up a concession stand where TAF members
and guests can purchase rotten tomatoes to throw at him, so we can see
if he's as good at dodging produce as he is at avoiding answering tough
questions in advocacy. All proceeds will go to charity, of course....

Also of course, TiFKAS will have to be able to get over the border to
attend, which we doubt he'll be able too, Ontario's anti-rabies patrol
are pretty strict....

>
> Video tape it and put on TAFT web site for later viewing..

not a bad idea, TiFKAS. We'll have to ask the maintainer of the web
site to see if he has the room....

HMMM, TiFKAS can't even spell acronyms right....

I think I have the addendum somewhere, and a couple original Stacy
language-disks as well. If you still want a copy in a month or so (I'm
moving ATM, and all my Atari-stuff is about 350km away...) just mail me,
and I'll send you a copy.

I think you need MiNT-Net for this, AFAIK there are no drivers currently
available for other stacks. In this case you need to install MiNT-Net and
set up the ethernet-card, this should all be covered in the instructions.

> N.AES 1.2 that came installed on the machine. I have not installed

The rumour say that this will be possible in MagiC 7. It *could* be
possible with STiNG today, but I have no idea if there are drivers
available for this network-card. I have not heard of any, but I haven't
paid any attention to the Atari-market the last couple of months.

Sorry ??? Pagestream and Calamus SL run rings around what ?

Pagestream 2.2b (Atari) is a great little piece of software, but a Mac
applications killer it ain't. I seem to recall in a discussion thread
one time Deron saying something about "He couldn't believe he produced
software like that" in a negative vein. I thought that was a bit harsh
if that's what he meant, but Pagestream (Mac) is a huge advance over
Pagestream 2.2.

Source record: 64515

Hi !

For my nostalgic pleasure i run a TT030 with a TC 1208 card, and with the MagiC Operating System it runs Calamus for example quite well. I even "surfed" with iCAB, but the configuration is complicated and the speed naturally is disappointing, even over the LAN port, compared to a contemporary Powermac for example.

Who can tell me, whether it is possible and makes sense to install Mint and Linux on this TT030, whether a functioning graphic desktop is possible and whether it is possible to go to surf from there with a Linux browser (Amaya for example) ?

Hi John, I understand your point - but I think that another part
of the problem is that there no way to type the address you've
given into Newsie (and MGFTP, and possibly others). They don't
have a place to put "ftp://", nor do they need it. So, I've
gotten used to doing it that way. However, MOST of the ftp site
addresses do start with "ftp", thus avoiding explanations like
this one. When I need to get an ftp address to put into a letter,
I just copy it from Newsie's ftp server list. I do believe if I were
to use CAB, and type the address you gave, it would probably take
me there just fine, even tho it does so thru Newsie. I wish I
could remember where I initially got that address.

>Also you need a trailing / to show it's a directory
>(again, most browsers will try to make the best of an incomplete URL,

The address I gave works fine with Newsie - what's wrong with the
other programs? Newsie doesn't need a trailing "/" in the address
line, so does that make me into one of those "increasing number
of people who don't know how to enter a proper URL..."? Am I a
Newsie-cripple"? It's Rojewsi's fault - HE MADE ME DO IT!! ;-)

>but as ftp directories tend not to have a default page such as
>index.html it doesn't work.

Hmmm, not sure what you mean here... "default page" for an ftp
site would simply be the address without subdirectories. In this
case: "dir.mcc.ac.uk". If you make a mistake in a subdirectory in
an "html" address, sometimes it will just take you to a main
page. I think that's what you're meaning. With "ftp" addesses,
the same thing sometimes will happen, and it will just go to the
root directory. Well, at least it does for me when using Newsie.
Then I can just work my way up thru the other directories.

>And unfortunately an increasing number of
>people don't know how to enter a proper URL for non-web resources. The
>URL is really:
>
>ftp://dir.mcc.ac.uk/pub/emagic/LOGIC/UPDATES/ATARI/

John, I do understand your point, and that you really are offering good advice, but at the same time I can't help feel you're treating me like some sort of novice to web surfing. Don't get me wrong - ANY help by anyone is a good thing for all, but sometimes it can be a tricky thing to offer advice without sounding a bit insulting. Try re-reading your letter from my perspective to hopefully to see where I'm coming from.

Your help/advice/suggestions are appreciated - thanks!

The output is via a standard RCA phone, as used on Sega master/megadrive,
Atari 2600/XL/XE, C64/c128... So you shuldn' have any problems. You don't
get the quality you'd get with a colour monitor though. You could try using
a SCART socket which will imporve picture quality.

Ishar III should work fine as the ST version runs on an ST or STE.

Yes, just like mon emulators there are colour emulators. Big colour allows
you to use colour only software on a mono monitor, in shades of grey, of
course!

Not all colour software will run with it. I have tried it with software that
you can run via the desktop OR you can try sticking the program BEFORE and
auto program you want to use.

Son't for get that the auto folder sequence depends on where in the ACTUAL
disk directory the program resides and NOT how you see it from the desktop;
unless you use a 'no sort' view or a directory sorter.

I think he's in the US, they don't seem to have SCART over there
(weird...). However, you can get Atari monitor socket to composite RCA
cables, though where you'd get such a thing in the US is beyond me.

IIRC these are hopeless for most games. However, I think the Ishar
series run on mono monitors anyway. Certainly the first one does.

That wasn't the point I was getting at. I was addressing your point
about PC/Mac programs. More accurately, their users.

Most of the PC FTP clients I've come across are like NEWSie, MG-FTP etc:
you don't enter the full URL there either. Certainly not in WS-FTP which
is one of the more common ones, and which I use regularly. However they
do understand full URLs if passed by a command line, just as AFTP and
NEWSie do (though the last time I used NEWSie in conjunction with CAB
this didn't work very well: things have doubtlessly improved).

The problem is that a lot of PC/Mac users (particularly novices) just
use their browser for everything, and have been encouraged into bad
habits WRT URLs. Just look at the number of advertisements which include
a web address - very few quote the full URL (including the http:// bit).
Nearly all start with www, but as this is just part of the host name it
has no bearing on the protocol used at all, just like not all FTP sites
are on a machine called ftp...

Most of the time this works because MSIE and Netscape (even CAB in later versions) try to use the incomplete URL as mentioned last time. So if presented with an address like the one you quoted a lot of people don't think they have to do anything for it to work even if you point out it's an FTP site. They just type it in as supplied and get nowhere.

> >Also you need a trailing / to show it's a directory

> Newsie-cripple"? It's Rojewsi's fault - HE MADE ME DO IT!! ;-)

This is nothing to do with NEWsie's behaviour or its effect on you (as mentioned above, NEWSie isn't using URLs internally). It's just that if a *URL* points to a directory it should end in a /, otherwise technically it's pointing to a file, in your case a file called ATARI (ie not a directory). My point is that if you are quoting an address you can't always rely on the software someone else is using coping with an incomplete URL in the same way. You can argue that you aren't quoting a URL as such, in which case, fine. But that is why some people are having trouble with it, not because they are PC/Mac users per se, or because PC/Mac programs are defective per se.

> >but as ftp directories tend not to have a default page such as

> Then I can just work my way up thru the other directories.

Nope. With HTTP, the standard behaviour when presented with a URL pointing to a directory, as opposed to a file (not a missing file, which should get a "not found" error), is for the server to display a default page in that directory (usually index.html or index.htm, but it depends on the server). Failing that it will display a directory listing unless this has been disabled in the permissions for that directory, in which case you'll get an error (usually on the lines of "access denied because you don't have permission to view this directory").

FTP behaviour is similar in that you should get a directory listing for the directory the URL points to. However if the URL looks like it's pointing to a file (when it should be pointing to a directory) you'll just get a "file not found" or similar. There is no equivalent to HTTP's looking for a default page, as such a thing doesn't exist in FTP. If you have an FTP URL pointing to a *host* (as opposed to a directory or

specific file on a host), then you'll find yourself with a listing of
the root directory on that host.

> John, I do understand your point, and that you really are
> offering good advice, but at the same time I can't help feel
> you're treating me like some sort of novice to web surfing.

On the contrary! You're experienced enough to know how to work your
software and input addresses sensibly.

The problem is with novices to web surfing who don't realise they have
to enter a full URL in a browser because most of the time they get away
with partial ones. Unfortunately this just doesn't work with non-web
addresses, so it's probably kinder to give them the full URL. Either way
they'll just type in what they are given - at least with the full URL
they'll get what they want most of the time.

People who are experienced will just enter what they need in the client
of their choice. I would guess that if someone is using an FTP client on
a PC or Mac rather than a browser they are probably experienced enough
to have worked it out, but I suspect I may be over-optimistic on this
one.

At the risk of labouring the point somewhat, I'm not criticising you
personally, and you can quote addresses however you wish, though I'd
argue that a full URL is at least a standard way of doing it.

I *am* arguing that the problem is *not* that PC/Mac programs can't work
with an FTP address that doesn't start ftp..., they can and do. The
problem is that if you don't quote a full URL a lot of novice users will
cheerfully type what they are given into a browser and it won't work.
Atari users are used to CAB not doing FTP internally, so assume that you
use an FTP client to access the site. Pretty much everyone else uses
browsers that handle FTP internally (and therefore seamlessly/invisibly
to novices), so you only use an FTP client for specific purposes, eg
uploading to web sites etc. Browsers will generally need a full URL to
be sure of working for non-web addresses.

Sorry if my previous message was less clear and could be taken the wrong
way. Hope this is clearer and you aren't offended by the lengthy
explanations. At least we can hopefully agree about what we're
disagreeing about! ('Scuse grammar.)

:-)

Hi NG.

Is there any finance/stock application that works with MagiC, in 256
colors.
Anyone know of any at all?

I need one that shows a graph for 10 - 15 differend at the same time.

cheers

Hi all.
Is there any chance of a NVDI printer driver for the Epson Stylus Color 760 printer.

I know there is one for PageStream, but it takes ages/hours to print in 720 dpi, it`s a lot quicker in 360 dpi, or I can use ImageCopy, at least to some extend, but I like one that take full advance of the printers capability.
Like printing in photo quality.

cheers

Joergen

a MiNT installation is certainly possible, and it works best (at
least from what I've heard and seen) with the N.AES enviroment.
Martin-Eric Racine, as an example, had the N.AES/MiNT combo running on
his TT at a TAF meeting two years ago, and it looked and ran
impressively.

Linux is also possible, indeed, our TAF president has now installed
Linux on his Falcon using the most recent Deneba Linux distribution, and
is currently tinkering with it.

3430. FS AutoSwitch Overscan, more pixels on your ST!

Newsgroup: comp.sys.atari.st
Date: 2000-03-12 00:00:00 UTC
From: BobF <BobF@techsoftware.freeserve.co.uk>
Message-ID: <8aghc8$lt4$1@news5.svr.pol.co.uk>
Source record: 64526

Forsale AutoSwitch OverScan

Graphics Extension for the Atari ST

Bit of a rare one this. The Overscan is a small board which
fits inside the Atari ST and which will give enhanced resolutions
on various types of monitor. The manual quotes some quite
impressive resolutions on various types of monitor e.g

SM124 704 x 480 (newer models)
NEC MultiSync II 720 x 480

The product includes

1. Board with plugs and flying leads requiring soldering to various
parts of the Atari ST
2. Comprehensive 66 page manual with fitting instructions and
details on how to program for the Overscan
3. Driver disk with software for setting up and controlling the
Overscan module.
4 Plastic wallet.

You will need to fit the board to your ST which requires fair
electronics ability.

The Overscan is compatible with NVDI (circa 1990), and
TurboST.

Note however that the Overscan is not compatible with
the Atari STe (hence the reason Im selling it).

Offers or more info to:

BobF@techsoftware.freeserve.co.uk

I believe the prblem could be that some of the European software was
designed to run at 50mHZ, rather than the 60mHZ the NTSC standard used
in North America supports.

There are some utilities and desk accessories out there that will
allow you to play these at the proper HZ rate (I know that Populous II
came with an Auto folder program for North American users)

3432. Need a Replacement Printer

Newsgroup: comp.sys.atari.st
Date: 2000-03-12 00:00:00 UTC
From: taj16@dreamscape.com
Message-ID: <scnjue5ta5n31@corp.supernews.com>
Source record: 64528

A crippling disability has just put my SLM804 laser printer into forced retirement. It's been a faithful machine, printing many a newsletter master for its original owner, and I've had a lot of fun with it, but it's time to move on. I know I could get another 804 or a 605 from Best Electronics, but I'd like to explore other options before deciding.

First I should say I'm using a Mega ST4 that is stock except for the TOS extension card with switchable TOS 1.4 and 2.06. I use TOS 2.06 virtually exclusively, except for games. I'm currently using a Toadfile 44 hard drive and ICD HD software, and expect to add a Syquest 200 Mb Removable HD in the very near future. I have an Epson LX800 9-pin printer I'm using for the time being, so I have enough time to do a thorough search.

My requirements are nothing special. I'm looking for output quality at least the equivalent of the SLM804, so that means either another laser or an inkjet. I'm not adverse to used equipment; my last major new equipment purchase was a disk drive for my 8-bit in 1988. I'm looking for low per-page operating cost; I don't want any proprietary non-refillable ink cartridges that only print about 25 pages. Color printing is unimportant. I need to be able to use xerographic and/or bond computer paper for daily use; I have a large supply I want to use. I could purchase special paper for special use events if necessary, but I don't particularly care for the idea.

The ability to work with PageStream 2.2b and SpeedoGDOS 4.1/AtariWorks 1.2 is essential. Since aquiring this system a year and a half ago these programs have become an important part of my personal and business computer use. I also use SpeedoGDOS with CAB and Newsie, and I want the ability to print from them once in a while. I'm not adverse to moving up to SpeedoGDOS 5 if necessary, if I can find it and if it will work properly with AtariWorks. The ability to work with Ultrascript or to accept Postscript output is _highly_ desirable. Epson emulation ability would be nice, so I can use some of my other programs with the new printer if I feel like it, like Image Cat or Print Master. (In truth, there is probably little I can do with Print Master I can't do with PageStream, but what the heck.) I'd like to be able to do screen dumps and use the TOS "print" file feature now and again. Printer drivers for the above software should be readily available, since I may not have them already. While I haven't started using it yet, I also have a Spectre GCR and several MAC programs, so I'd like a printer I can use with them, too.

Any suggestions? And possibly more important, anything I should avoid?

Hi there!

What version of NVDI do you use. I know that NVDI 5 supports most of the new features on nearly every printer I can think of. As well as all the nice effects such as background printing under Magic.

Hello all!

I have been using Pagestream 2.2SE for a while now with my HP Deskjet 600 printer. As you all are aware the later models of deskjet have no DIP switches and paper sizes must be set using software. Unfortunately the Deskjet defaults to US Letter size paper so without updated drivers, pagestream is not able to print to the bottom of an A4 page.

Has anyone else who has had this problem been able to get round it? I have tried all the included HP Deskjet drivers (colour and mono).

All my other applications use NVDI 5 and as a result there is no problem there.

Cheers

In fact, the GFA Basic Interpreter V3.5 was on an ST Format cover disk
#35B in June 92, complete with a 200 kB manual. I bought the proper
manual from GFA at the time. Not sure if that version is downloadable,
or he has to find someone to sell him the cover disk.

BTW, I have a spare V3.07 with manual, if anyone wants it for the cost
of p&p - say 3 or 4 quid.

Hi,

I used to operate a similar set: TT with 64 megs RAM, TC1208 and Magic
5.01, plus CAB 2.5

Fun, but slow. I had Debian Linux sitting on it for a while, without
X-Window and the X-Window stuff will make it like cranking up an old
T-Ford manually during midwinter in Siberia.
I also had Mint somuch including N.AES 1.2 which ran pretty well but
surfin' wasn't faster there. Standard desktop for me under both MagiC
and Mint/NAES was Thing, pretty good.

Forget about Gnome or KDE for the TT, and it remains to be seen
whether or not those browsers are available for Linux-030...

My standard machine became a PIII-450. I'm not even trying to get the
TT cracked up for better speed :-) It's now being used as storage
medium for files...

Yes, but a mono monitor can't display grey scale, only black or white.
Therefore all colours would be black, except white, and you wouldn't see
anything. There are a few colour emulators for mono monitors, but they won't
work with most games (those that boot from a floppy), and it would give an
unreadable display anyway.

Hi Fred

I'm using NVDI 4.11 on my Milan without problems. There were some
problems too begin with but that was due too running order.
Run NVDI before Mint and comment out all the NVDISYS files and all
should be fine.

Or I use Parafin.Prg as it's very fast for any file searching by extender
or file name, it uses wildcards in both and any combination of
partitions/drives.

When you go to create a Doc in Pagestream when you select, under the
'File' menu, New the dialog give you option of A4 page size. I think
that you can specify the size of the A4 in the print dialog which should
set the printer up for a A4.

3452. CAB.OVL 1.4001 Update available

Newsgroup: comp.sys.atari.st
Date: 2000-03-13 00:00:00 UTC
From: baldrick@dilbert.netset.com
Message-ID: <38cc8092$1_1@athena.netset.com>
Source record: 64399

Small patched version up on my web site. Both an 030 and 68k
version in the archive.

http://www.netset.com/~baldrick/

Handles problems with incorrectly formatted URLs and redirection.
ie. You can now use the services on the US Yahoo site.

As to the Map problem. Can anyone use Yahoo maps and CAB? From
their search page? I can build a URL to pull a specific map down and then
all works fine. However CAB just doesn't seem to want to do the search
with the method they are using. If someone has CAB doing this with any
OVL please let me know.

Thanks and have fun,

Dan Ackerman
aka baldrick...

3453. Atari Midi Artists HALL OF FAME

Please refer to the manual/README about media that are at the same time
TOS and DOS compatible. Depending on the TOS version there is an upper
limit for the capacities of the *single* partition you may create for
that purpose.

I know someone who wants to buy an ST and use it for Midi work, what
software is available for this?, will it run on a standard 512K ST with a
floppy drive or would they be better off with a better spec ST?.
I suppose that ultimatly they would be better off with a Falcon but I don't
think they want to pay they much.

Thanks,
Stephen Moss.

Source record: 64403

Hi all,

New version of my ear trainer was released a few days ago, but
since feedback and registrations have been at a low level I am thinking
about dropping this project now.

There have been a number of improvements since last version:

-Improved chord trainer (Practice on the 26 built-in chords, or define
your own)
-Interval statistics now reports how many attempts were made on every
interval.
-BubbleGEM is now supported.
-Nicer interface! (Separate RSC-file for newer AES.)
-All strings moved to RSC-file
-Dialog to enable/disable BubbleGEM and zoom-boxes
-Bugfixes

Go to http://hem.passagen.se/gokmase/atari to download.

Ok, thanks to all nice people that have supported this project! :)

Regards,

Joakim

I think a 1040ST is the bare minimum. Floppy works, but slowly,
so a hard-disk is almost a must. Memory also proves limiting,
especially using Cubase with all modules loaded.

Installing an internal IDE drive (using Mario Becroft's adapter;
see http://gem.win.co.nz) would be best. It will also require
upgrading to TOS 2.06, which is easier to do if you have an STE,
where important chips are socketed.

Another question: where you can legally buy TOS 2.x ?

Something crossed my mind while reading this...What would happen with PC
if IBM prevented clone manufacturers in making them ?? What would happen
with Beta video system if Sony would sold license...
There is probably many other example.

Pera

They should at least have 1Mb of RAM. There is no problem running from a floppy for most MIDI apps. A good compromise is an STE that can start out at 512K (but again, 1Mb is must for most programs) and be easily upgraded to 4Mb. It's also a good idea to buy a complete Midi package with ST, monitor and software, because it can be tricky finding original programs nowadays.

|> >getting rather fed up with the NVDI |5/Pap 5 bug... ;-)
|>
|> And what bug is that??.
|
|It's actually mentioned in the NVDI 5 manual (FAQ pg22)
|"Q. In Papyrus, the layout and positio of object is wrong. Why is this?
|A. Your version of Papyrus has an error in the resolution inquiry, which is
|fixed in Papyrus 6"
|
|If you try designing complex documents with frames/graphics more than likely
|the layout will be all wrong, especially with right-aligned objects. I
|contacted System Solutions when I upgraded to NVDI, but they said that Pap 6
|was no longer available. I have been waiting since then (now almost a year) for
|a new version of papyrus.......... :-(Hopefully some day soon.. keeping
|fingers crossed!

The only recurrent bugs I have noticed in Papyrus are one when
printing backwards, and one when editing large double column files.

I have not tested this extensively but when I print on both sides of
the paper, I print the odd pages first then the even pages
backwards. After the last page the program crashes, I suspect only
if the numbers of pages is even or odd - I am not sure.

In the re-editing of large double column files the program writes
the new information without erasing the old, so that everying gets
overwritten and unreadable. This is cured in the demo of version 8.

There is a cpx which allows you to change settings in HP printers
but I am uncertain whether one is available for all printers.
Perhaps the laserjet one will change paper size on inkjets? It's
called HP_LJ.CPX.

|My requirements are nothing special. I'm looking for output quality at
|least the equivalent of the SLM804, so that means either another laser or
|an inkjet.

AFAIK a laser will give a better output than an inkjet at equivalent
resolution because the dot size is smaller. What you buy depends on
what you want and what drivers you have with your programs. I can't
help with those aspects but I have a LaserJet 5P (600 dpi) and am
very pleased with it when used with Papyrus.

You're the second one I know about who are unable to reach the RMA with
Newsie. Mind you last weekend the server was down but right now the server
is up and running again. Have you tried to access the server with Cab,
Aftp or whatever ftp-program? Which TCP/IP stack are you using? In case of
STing you must make sure you're using the latest version. With earlier
versions there was an access problem. In fact this wasn't the fault of
STing but rather a configuration fault of a server just outside the RMA.
The latest version of STing can deal with this fault.

>quite a lot.

Can't really be of any help I'm afraid apart from just to say you are
not the only one with these problems.
I too have had the delay before the page downloads. I generally press "stop"
and try again which normally starts to the download the page immediately.
I thought too that this may be a STinG configuration issue but when I tested
Olivier's OVL (5.68) this problem didn't occur - this generally downloads
straight away, sometimes before any incomming data readout is output
within CAB.

The "Connection reset by peer" happens here too - sometimes CAB
continues through this but mostly 2 bombs appear. I've mentioned this
to Dan and I'm sure time allowing, he'll get around to looking at this
as I'm sure we can't be the only users finding these errors.
This is with a standard STfm or STe system, 4MB running MagiC 6.01 and
Jinnee 1.02.

Best Wishes
Sean

Not a problem, a feature;-).

Yes, on many early STs the chips seem to become unseated. Thus the reason that pretty much everyone on this NG is familiar with the "4inch drop" as a procedure to reseat the chips. Generally I just push down on everything listed in this thread, and the bombs disapear and the Gem desktop reappears.

I hope everything works out for you.

Brian.

What Nick said is good as far as a machine.... the more memory the better. Most Atari midi Apps work on 1 meg, but would be better with more. I would like to point out that some great midi apps are now at my site thanks to the original programmers and companies that released them. Master Tracks Pro and RealTime are excellent sequencers which many "proffessionals" sweared by.However, the "biggies" like Cubase or Notator are Not available freely, so I am "still" after them!However, there are some people who DO sell them trying to upgrade to a better platform for midi. (but we know better!)See my sig for my site.

3469. Decitala for KCS available

Newsgroup: comp.sys.atari.st
Date: 2000-03-13 00:00:00 UTC
From: Tim Conrardy <timconrardy@my-deja.com>
Message-ID: <8ajj7kbto1@nnrp1.deja.com>
Source record: 64416

The DECITALA Rhythms. By Chas Stoddard.

Now available on my KCS page.See signature.

For use with OMEGA II. 126 different rhythms in KCS and Midi File format.

Chas has given me permission to have his amazing KCS files as a download to use with Omega II KCS. The rhythms are also available in Standard midi file format so you can use any sequencer to load them, including TIGER CUB.However the full use of these files can only be experienced in KCS.Once you load the ALL file,and go into OPEN PLAY mode, you are presented with the 120 principle motifs (or patterns) used in traditional Indian Music. All you need do is press the corresponding QWERTY keys and you can play them. You can play several at a time for some interesting polyrhythms. The real beauty is bringing them into SONG EDIT and linking them to form complete songs as well as overlapping them for polyrhythmic expression and transposing them to obtain different voices.You do not need to use percussion sounds as these work very well with "tuned" percussive sounds such as Marimba, or Vibraphone.Chas has complete instructions on how to use the files and is very informative. Of course you do not have to create "indian" music with these files, but can be a basis for some energetic and complex Rhythms that can be used in any style of music.ENJOY!

> pc.

No. His current version should be fine. I have HDdriver 7.71 from Uwe
and all I did was attach my SyJet to my Falcon, and boot up. Once
HDdriver was configured to look for the SCSI id of the SyJet
it worked fine. I partitioned it into 3 partitions, and I suppose I
could have formatted it but usually there is no need. Perhaps the SyJet
cartridge is problematic?? I know that one SyJet
cartridge I had would not partition, and ejected itself after a couple
of minutes.

Why does he need to use BigDOS? When you partiton the cartridge, check
out the section under compatibility. I think it can only be one
partition if you go for DOS compatibility(I never bother),
ask Uwe, he would know! :-)
Would it not be better to format, sector test, then partition? or skip
the format altogether?

After you configure your hddriver.sys on C:\ drive. go to "locate
hddriver" and reload the hddriver.sys from c:\
Many time I have found that the first few times I install HDdriver, the
reloading of hddriver.sys shows that not all options were saved as they
should have been. I had to make the corrections, and re-install
hddriver.sys on the c:\ drive. It may be that you selected hddriver to
see that SyJet SCSI id, but when you installed hdriver to the c:\
partition it may not have 'taken'
so check your hddriver.sys when you boot up hdutil.prg

3471. Gemulator and MagiC

Newsgroup: comp.sys.atari.st
Date: 2000-03-13 00:00:00 UTC
From: Terence Kelly <tkelly@pressenter.com>
Message-ID: <8ajo0lisq1@jair.pressenter.com>
Source record: 64418

Has anyone had any luck getting Gemulator 2000 to work with MagiC 4 or 5. I can get the emulator to work correctly with TOS 2.06 but under MagiC it won't read directories properly. In the file selector they show up as 0 byte files. The larger screen modes also seem to be a bust using MagiC. I have been trying to update the Niff (Note Interchange File Format) file import for my ST scoring program Proscore. It would be nice to be able to have my multitasking ST environment available on the PC that runs my music scanning software so I could develop on one machine. (Alas, Smartscore, the notation scanner, is not available for the Atari). I guess I could always try MagiCPC. Does anyone know if that is available from a dealer in the US?

Download the drivers from my web site (elfsoft.home.mindspring.com).
The read_me tells yor what paper sizes are available and how to use
them.

Now if I could only get docs on my HP5L, I could write a driver for
it too...

I believe that Brother has a LED printer (a close relative of a
laser) that has Epson emulation. I've seen Brother Laser
printers hooked up to a Falcon, so I suspect you'd be O.K., and
most laser printers are less expensive than inkjet due to the
price of ink.

Hi pera

>> >Where can I download a TOS image?

>> Nowhere legally.

> Another question: where you can legally buy TOS 2.x ?

You'd probably be better off and save some money buying a used machine
with it in

> Something crossed my mind while reading this... What would happen with PC
> if IBM prevented clone manufacturers in making them ??

They would all have IBM badges on them and you'd buy them from one place.

>What would happen with Beta video system if Sony would sold license...

It probably would also dissapear.

> There is probably many other example.

Thats life, someone stops making something and it then dissappears from the
face of the earth, except for a few clones which are effectivley stolen
goods then, like downloading TOS..

Hi Thomas

>Any suggestions? And possibly more important, anything I should avoid?

My personal choice was a laser printer. I read an article once on the running costs of an inkjet vs. a laser. It was quite an eye opener. So shortly afterwards i went out and bought a Laser printer, that was about 4 years ago, ive yet to change the toner cart, whereas i'd be poping ink in every couple of months on my DeskJet 560C.

My personal choice was a LaserJet 5L from Hewlett Packard.

Hi Trevor

>>Ive got a PRG thats called SDCAB that will pop up a fileselector after a
>>CAB download prompting for a Human readable filename and destination,
>>allows you to copy or move from cache to ?:\xxx\xx.

>Or I use Parafin.Prg as it's very fast for any file searching by extender
>or file name,

The only problem with that is that CAB does not provide a human readable
filename, so you'l have to search for an extender and test each one, or
just search for files from a specific date, this may fail as some files are
like 10 years old.

>it uses wildcards in both and any combination of partitions/drives.

Its also possible to re-enter the URL in offline mode, this would force a
download from the cache, if CAB is setup properly a fileselector will
appear, if not its time to tweak CAB a touch.

Hi Jerry,-

I`m using NVDI v.5.03. Haven`t found any driver for the 760 in the driver list, and I haven`t really tryed yet. Just got the printer yesterday. Have to play around a little with the printer set up, to se if it will work?
- 2 hours later -

I just made a small test, and I am not satisfied.

It did not work proberly with Papyrus 8 and the driver for 740 or the 800.

cheers

Actually, I have been - just a bit behind.

I read all my stuff offline with NEWSie. In this particular case, I replied to one of the original messages about a week after it was posted. At the time I think there was maybe 1 other reply. However, by the time I got around to uploading the message, _many_ others had stepped in and my reply was no longer "timely" - but I didn't know this since I didn't see the new messages until _after_ my reply was uploaded.

..a drawback to reading and posting offline - as time permits (I have a very busy work schedule!)

3492. MagiC Bootup Oddities

Newsgroup: comp.sys.atari.st
Date: 2000-03-14 00:00:00 UTC
From: Nurmix@socal.SPAM
Message-ID: <8ak4el11ftf@enews4.newsguy.com>
Source record: 64438

[This is with MagiC 5.11]

What is it that causes MagiC to _nearly finish_ booting to the Magxdesk desktop, after appearing to load everything in the START folder, then at the end of the process, up pops the file selector in the C:\GEMSYS\GEMDESK\ directory, asking for a program to run?

It doesn't matter which app you choose, or if you choose nothing at all and simply click [OK], MagiC will finish the boot, and everything will seem to be normal. But, when it comes time to shutdown, it takes _2_ shutdowns to do it.

It seems to happen to me every few months, and usually I find that MGNOTICE.APP is the culprit - at least if I disable it, Magxdesk appears normally without the file selector popping up, and shutdowns work as they should.

In the past, recopying the START folder apps from a backup would sometimes help, but not today. Disabling MGNOTICE did fix it, but I really do need to use MGNOTICE. I know it can be run from the desktop, but running it from the START folder is really the best way.

It's almost like the running order of the START folder apps gets messed up, and MGNOTICE runs before something it shouldn't, and causes the problem.

Does this happen to anyone else here? Any ideas?

-Paul

3493. Micq 4.4 for StiK API patch 1 released

Newsgroup: comp.sys.atari.st
Date: 2000-03-14 00:00:00 UTC
From: baldrick@dilbert.netset.com
Message-ID: <38cdd08c$1_1@athena.netset.com>
Source record: 64439

I just got the announcement tonight and ported it tonight.
I'm certain there will be some problems floating around in it from my
port.

Hopefully works at least as well as the last version.

Micq 4.4

A command line (TOS) client for communicating with the mirabilis
ICQ server. If you don't know what it is, Jerry martin has a nice site
setup explaining it all. There is alink via my page right under the micq
link. Sorry I can't remember the URL atm.

Dan Ackerman
aka baldrick

3 public releases of 3 different programs in 3 days aint bad. You folks
are just lucky that Sinclap hasn't convinced me that programming on my
atari is a sin ;)

ps sorry for the convolutedness of this message. Sleep
deprivation is setting in.

It is perfectly possible to install Linux and have X Windows
running. I have been using Debian GNU/Linux on my TT clone for
some time now. The browsers that come with the current version
of Debian (2.1) includes Amaya but a rather old version. There
is a port of Mozilla available for the M68K and I think this
may even be included with the next release of Debian.

3496. For Sale: Atari 1040 STF w/Monitor,Mark Williams C,Hard Drive, and more!!

Newsgroup: comp.sys.atari.st
Date: 2000-03-14 00:00:00 UTC
From: ginsu@gate.net
Message-ID: <8akovc$1ang$1@news.gate.net>
Source record: 64442

Hi.
I've got some Atari stuff for sale.
Here it is:

Atari 1040 STF computer with mouse.

Atari SC1224 color RGB monitor.

Supra 20MB external hard drive.

Mark Williams C Compiler with original disks and ALL the manuals!

A few years worth of START magazine disks.

A few games complete with boxes and manuals: Gauntlet, Rogue, and Sundog.

Everything is in working order, and the hard drive looks brand new!

The monitor and system show some regular use, and look good!

$100 buys it all!

Any questions, please send email to: ginsu@gate.net

Thanks,
- Robert

You can set it in the ovl config file that should be in the same directory as the ovl itself. I think it is the last option in the file.

Mike

3498. [GAMES] Lots of update

Newsgroup: comp.sys.atari.st
Date: 2000-03-14 00:00:00 UTC
From: Patrice Mandin <pmandin@caramail.com>
Message-ID: <8al5p1$g4p$1@nnrp1.deja.com>
Source record: 64444

Hello,

I just updated Doom, Heretic, Hexen et Quake.
The three first ones are now 0.24. The only difference is network
support (TCP/IP via MintNet) not tested.
For Quake, I corrected the stack site. Textures can be disabled to go
faster (twice as fast without textures).
The 4 executables have been cross-compiled on PC (faster than my
Falcon). So I have compiled an FPU version of Quake (not tested)

I take it you are referring to stock quotes. There was a program called
"stalk the market" released back in the days, not sure how powerful it was
as far as getting streaming quote data.

You could possibly do this web based if CAB supported the meta refresh tag.
I don't know if it does.

I'm a registrated user of Boxkite but for some reason I don't like it
hence I don't use it very often. The time I'm using it (with my
Jinnee/N_AES setup) I never have encounter any problem. It seems very
stable to me.

>Hmmm in which case I think I'll give it a miss.

Sure some people might have some problems and to be honest I also have
some (minor) problem myself but it certainly offers some very nice
features which you can't find with other FS. I do love Freedom. As long as
the problems aren't serious I'll use Freedom.

>>
>That's another alternative, I don't use long file names anyway, when I

That's odd. Most modern program can handle long filenames without any
hassle. What were the problems?

Note that a new version of HDDRIVER is not always able to use
configuration data of old versions. If this is the case, HDDRUTIL will
tell you. Otherwise the old configuration data will also be used for the
new version.

On 14 Mar 2000 06:33:20 , the sinclap Random String Generator spewed:

>Won't get anywere in life without ambition and playing second fiddle...

Very true, and it's even worse if you don't even have a
life, like a piece of software that spends all its time
sending useless garbage to comp.sys.atari.st, rather
like a... sinclap Random String Generator!

What a waste of CPU cycles. Ideal for testing powerful
processors. A friend of mine just got one of the new
500MHz Apple G4 machines, and he reports the sinclapBENCH
utility returns an impressive score of 3.2! Roughly
equivalent to the IQ of a person bored enough to spend lots
of time posting useless garbage to comp.sys.atar.st!

Of course, we all know there are no such people...

Fame at last (at least in AltaVista?)

>I too use 2.7 and if I'm actually downloading files - say from Uwe's
>site - the file selector is called once the file download is complete
>and I can choose where and what I want to call it. What setting do you
>have in the CAB viewers option for binary files? I have what was setup
>when I bought it: *.hqx,bin,uue I don't know if changing this would make
>you lose the file selector?

Yes, I have the same. But I didn't get the file selector. I've left most
of the default paths, but added 1st-Guide for most images and Look'n See
as the default viewer.

>As Steve says, this is a good way to trace your files but another method
>I use to do this is (if it's an important site like say MagiC online
>etc) I go to the page online and if there are pages I want to read
>(for example the interviews with atari authors) I save the main MagiC
>home page in my "Hotlist" then click on to the various interview pages
>I want to read - but *don't* actually read them. Once I have all the pages
>required in my cache I can then go offline.

What I tend to do is to go to the home page, if it's a short one I'll
read it and click on any linked pages I am interested in - but log off
without reading them online. Then I get them from the cache.

Part of my problem has been with getting the hotlist set up, because
it's quite different in 2.7 from that described in the manual that came
with it - which was for 2.5!

I find that I can't get IConnect to work - it dials and negotiates but
doesn't get the required response from the ISP and comes up with an
error dialog. But STing works fine.

Regards, /Peter/

HI All,

Now a good music related thread has started in this newsgroup I'm going to have a good go at keeping it going...

Tim, great idea at compiling a list of professional atari users, although some of these could be classed as past atari users.
How about a list of present atari midi users, professional or not, together with what hardware/software we use (and contact addresses/comments etc.)
This probably wouldn't be as huge and unweildy as you might think; there probably aren't that many of us but enough to give us a morale boost. Maybe form a club or mailing list.

Which brings me to something I've wondered for a while....

WHY ISN'T THERE AN ATARI-MUSIC NEWSGROUP ???

I spend ages trawling this newsgroup (which can get pretty busy) for music related stuff. I'd be much happier with a music specific one, then I'd have more time for writing music.

How do you go about starting a newsgoup anyway?

Cheers! Simon.

He tried to partition it into 2 . He was also trying to make them DOS compatible. He got a error saying only compatiable with BigDOS or Magic 5. This came up twice one for each partition. He was able to make TOS partitions with out any problem. My main thing is to be able to swap between the TT,ST and PC this is why I need to see him make a DOS partition that works on my PC. I hate using the PC for this type of use I rather do it all on the Atari but the PC CDRW was cheaper and easier to find.

>

> that purpose.

The TOS on his TT is 3.6 and I have both 3.1 and 3.6 on the TT and 2.6 on the ST . I havent read his manual but he has but, he must be missing something still.

Were missing something but, I dont know what.

Thanks Don

Hi Ken,

KM>Why does he need to use BigDOS?
for all TOS < 4.00 don't give access to partitions bigger than 256 Mb.
HDDRIVER allows you such partitioning, but warns you of possible 'no
access'.

Of course, instead of BigDOS, you may use MagiC to get onto a big part
like that.

Hi,
I want to buy a scanner Umax for my Falcon and the UMAX 1220 S is
actually not make and substitute by the new UMAX Astra 2200 US.
The 2200 US is it compatible with the 1220 S ? and the drivers Scan-X of
Homa or Sandrine of Centek work with this new scanner ?

Anybody as been tested the 2200 US on Atari with the SCSI port ?

Bye,
Pascal.

On 15 Mar 2000 14:55:02 , "Daniel L. Dreibelbis" got a bit
confused and thought he was arguing with someone called
sinclap, getting rather involved. Daniel, cool down! Don't
get so worked up! You've fallen into the trap of thinking
that sinclap is a real person! It's not! It's nothing more
than an insidious piece of software that creates nonsense
out of the English language and posts it to the place we hang
out in called comp.sys.atari.st! It is none other than:

The sinclap Random String Generator!

Any attempt at intelligent communication with the sinclap
will fail miserably, as it has no ability to comprehend!

Your not alone. I also never could use Newsie to access ftp-servers. IMHO
Newsie isn't particulary suitable for that job. You'd better use a decent
ftp prog like 'aftp' or 'mgftp'
>
>Now to find a site with 1.22 (?)

The latest drivers can be found on the homepage of Ronald Andersson:

http://www.ettnet.se/~dlanor/sting/html/index.htm

For aftp and mgftp see the UTSI pages (URL in my signature) section

Hello everyone,

The drum in my old SLM804 is going out, and the toner is getting
rather low, too. Can anybody suggest a supplier who still sells
these items? Preferably in USA for shipping reasons, but I'll
order from anywhere if necessary.

Also, are there any other printers out there that use the same
print engine and therefore might use compatible parts?

Many thanks,

--

I now use Suji, which is faster and also gives more info. BUT! - for that sort of thing you need to know what the filenames are called and of course I don't know that for files downloaded from external sites! In fact the ones I downloaded only had numbers :-(

There is another advantage using lasers over inkjets for the production
of master pages that I haven't heard mentioned before: The printout is
(relatively) waterproof - as I found during the summer when a few drops
of sweat ruined several pages I was photocoping from :-(The fused
toner from a laser should be OK once the drop has dried or been blotted.

>In your case you'd have to T(ranslate)TFM and then R(ead)TFM.

Well... Actually I got CAB 2.7 but with a 2.6 english manual. One problem is that the hotlist handling has changed completely from that described. I found I could drag entries into the required folders or order, but I still can't understand the meaning of the little icons to the left of the entries - specially the 'bar' that's first in the line and disappears when you click on it - what does that do?

Regards, /Peter/

I haven't encountered this one even though I do print a large double column document I am working on. I suspect that I haven't printed it backwards yet. papyrus 5.15 and NVDI 5.03

>In the re-editing of large double column files the program writes
>the new information without erasing the old, so that everying gets
>overwritten and unreadable. This is cured in the demo of version 8.

Not found this either. The only bugs I have experienced are:

1. Imported GEM (vector) images appear with large areas of white space around them. This didn't happen with the earlier version (4) of Papyrus I had.
2. When moving to the menu-bar it sometimes refuses to respond and only comes back to life if I move to the left most (Papyrus) menu. This may be related to a sleepy scroll bars bug that sometimes affects Papyrus (well my version at least).
3. Imported raster images sometimes appear severely distorted but a change of magnification fixes the problem.

I am using N.AES/Mint.

Having said all that Papyrus and NVDI are excellent. Papyrus is far better than the "standard" dross that I get given on my office PC.
I just love the "sort for binding option" on the printer and "why the beep?" makes me chuckle. It's like "Why the *&%!?@! ?"
I like the ability to grab the vertical slider and just slide up the document in real time (Milan).
The option to micro-space lines, such as 1.3 line spacing is superb.
Tables are so much easier than dross word-p, they can be edited without becoming a total mess.
Enumeration is logical and the two sets of tags make layouts easy to tailor.

There are loads of other features that make Papyrus a joy to use.
Now if they could just get version 8 released in English ;-)

Regards,

Peter

Hi Tim,

Ian Boddy (synth musician) did use the Atari first with Pro24 and
then the Cubase family of programmes but has now moved on to the
Mac because he needed the extra power and speed for the projects
he was working on.
When he was revamping some of his old music he had to borrow one
of my machines to transfer the files ;-)

Paddy MacAloon (Prefab Sprout) was exclusively still using his ST
the last time I visited his home studio, but that was a couple of
years back now....

I have the 2400S which works with the scan-x software on my TT.
Tried the centek stuff (demo) but all I got was a locked up computer.
You can try the scan-x web page and see if there is a demo,
if not you might write the author. Actually the 2400S wasn't supported
at the time I bought it but Nima was kind enough to add it.

Now you're just splitting hairs, the only /true/ mono monitors were of the
TTL type such as used with the amstrad CPC64, so called amber and green
screens.

The term monochrome is used in the industry to specify the difference
between black and white and colour systems rather than between greyscale
and duochrome, and it is not a technical specification..

I agree with all that. I have an A3 monitor as well and normally
work at 200% and see the entire width of the page. Superb. Mind you
the monitor is so big it is on a stand on the opposite side of the
desk and I have to use the zoom (plus a special pair of glasses for
working at the computer!).

Jerry,

I've seen this same problem with setting legal size with any of the newer HP printers. The printer must be set so that its default paper size is A4, otherwise you can only get the first page to print in the correct size. HP started using something called "printer jet language" that is different from the escape codes that were standard when Pagestream was an up to date product. You can make a short program in C or GFA Basic to set the printers default to A4. I've already helped someone do it for legal size on an HP5L. E-mail me if you really need this feature, and I will send you the code I used.

Hi Tim.

I don't have much information, but I do know that the group Midnight Oil from Australia used Ataris. They were in Canada on tour and stopped into one of the then Last Atari Dealers in Canada, JMG Compushoppe, and purchased a number of Atari Softwares, including the program JMG wrote called Hyperlink.

Then the owners of the store where invited to the concert and all the backstage stuff.

Later Brian.

Many were just handed an Atari for the endorsement picture, but
bought a Mac like everyone else in L.A. just because Mac was more
fashionable.

Real people like Jeff Rona still keep an ST on hand, though,
because they know better.

Yes, this is correct. So he should simply use MagiC, Big-DOS or MiNT.
Fact is there is no problem in transferring data this way. Of course he
can also parittion the medium with DOS/Windows and use it with the
Atari, Big-DOS, MagiC or MiNT provided.

> The TOS on his TT is 3.6 and I have both 3.1 and 3.6 on the TT and 2.6 on
> the ST . I havent read his manual but he has but, he must be missing
> something still.

The maximum partition size for TOS 3.06 or 3.01 (there is no 3.1 or 3.6)
without MagiC or MiNT or Big-DOS is 512 MB.

> anybody in the USA has an atari 520 or 1040 st they want to get rid
> of I would like to have one.

I run the following ad occasionaly. You may be interested.

The time has come for a new owner for the Bear Cavern BBS's equipment.

The following Atari equipment and software are for sale for $500 plus
handling and shipping.

Optional: Will include an APC BackUPs 400 UPS for an additional $40 plus
handling and shipping.

1 Atari Mega 4 STe equipt with 50 MB hard drive, Ajax chip, 1.44 floppy
drive. With a JinMouse (better than an Atari Mouse).

1 Atari 14" swivel base monochrome monitors.

1 Atari SC1224 color monitor.

1 1.1 Gigabit Seagate SCSI Toad Tower Hard Drive with Adaptic card.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
This hard drive is the one used with the BBS and contains several hundred
Atari, MSDOS and Windows files.

1 540 MB Quantum hard drive with an ICD II adapter.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
Built in the same box, a 750 kb floppy drive. The floppy is good but the
cord length makes it unreliable. Best to remove it and use it as intended.

The BBS software is BB/ST by Quantum Microsystems. Old but reliable.
The program has been improved by Anthony Watson (Mountain Software),
improving the file library and the File attached Mail.

Maintenance software on the BBS includes, Diamond Edge, Diamond Back, ICD Pro
Utilities, SCSIWAIT 3.

Two external SupraFAXmodems, 1 v32.bis and the other 33.6 (these are the ones
with the display)

Dozens, if not hundreds of 750 kb disks with commercial software, Magazine
files, and STReports downloads and manuals. (Also the Best Electronics
catalog).

Cords, powered monitor switch (will switch from one monitor to another
including the AC)

Mega STe Field Manual

Lots of software

> > are pretty strict....
>
> Americans sail through with ease with badly needed U.S. dollars to
> suppor the economy..

except for the ones like TiFKAS, for whom they are ready with the
rubber gloves and the tranquilizer darts....

more likely the Americans are coming to buy inexpensive products of
equal value to badly overpriced goods in the American stores. We value
American tourists, it's one reason why our economy here has been booming
as of late

BTW, why trust TiFKAS, a child who can't even spell "support", to
comment accurately on the current strong Canadian economy? And who

admittedly uses as his basis for his "info" the National Pest, a source which a recent poll here has shown that less than 9% of Canadians trust for accurate reporting, thanks in part to the crybabying of his personal hero Conrad "Tubby" Black, who's upset that the government won't let him become an English Lord? TiFKAS should be more concerned that the Daily Tubby is currently drowning in red ink....

It's always hilarious to see TiFKAS, when losing an argument, to go as far to attack an entire country. Could it be because the guys most successful at kicking his butt come from Canada?

> >
> > HMMM, TiFKAS can't even spell acronyms right....

It's not that I can't setup an A4 page in Pagestream, just that the Deskjet refuses to print the bottom few lines of it. I need a printer driver which sets the printer to A4 page size before begininning printing! ;-)

> one will change paper size on inkjets? It's > called HP_LJ.CPX.

I already have a utility (deskaccessory) called 'JetSet' which lets me send commands to the printer. This works fine for the first page if I use the HPLJ driver. The for some reason, before subsequent pages, the driver sends a reset command to the printer which restores the default US Letter page size.

And very annoyingly the other Deskjet drivers all send a reset command before printing, including the colour ones making printing in colour on an A4 page slightly difficult!

Really I need a driver which will either NOT send a reset command at all, OR one which will send the appropriate A4 page code to the printer before printing. (OR else some way of convincing my Deskjet that it lives in Europe! ;-)

Thanks for your help,

Jerry

Hi Preben,

There's an MP3 encoder just ported from UNIX available on Kellis' page. The address is
http://kellis.atari.org

You should find alink to it in the MiNTOS - News section.

Apparently it works, but is S-L-O-W ;-)

Yes..It is a list of past users. I don't really know who uses Atari
Today. I am sure there are people, but it goes to show how Atari has
shaped the music industry, and that it was not a "game" computer but
could be used creatively in a wide range of music styles.

> How about a list of present atari midi users, professional or not,

I feel the same way. Most of the time I am up here on this newsgrp and
happy to respond to Midi stuff as well as here about it. I was thinking
of Creating a Mail-list in the same note as the NOTATOR mail list
started by Hallvard, but with Atari-Midi as the subject. I have to see
what is involved. There is ONE-LIST which might be a good solution.

Would ANY ONE be Interested in a ATARI-MIDI MAIL-LIST?

I belong to several at this time: Notator, mirage, Dx-7 and Algo-
comp.Quite Informative and it's fun. You really get to know the people,
much like in this newsgrp.

Might as well give it away. A 520STF is worthless nowadays. A 1040 is worth
a bit more.

This doesn't mean they are unuseable (even though a bare bones 520 isn't far
from it), just that you wouldn't sell them. You could give it away to a
school or a hospital to play games on it.

> with it in

I have 3 Atari ST already... And how can I know is TOS upgrade in
machine, which I want to buy legal ?
But it's not the point. Why prevent people from using obsolete software,
what is for many years not distributed ?
Who will have any loss from it ? If something is not buyable you have two
choice (now with Internet) : to not have it, or to download it. Why
copyright holder of TOS doesn't have WEBsite, where you can legally buy it ?
I'm sure that reason is simple: they are not interested, because traffic
will be too little.

>

>
> It probably would also dissapear.

I think that PC in that case would not be most used personal computer
architecture in World.

Actually Beta is disappeared, but from reason that VHS took domination,
and finally Sony started to produce VHS video recorders too (under license
of
course).
That's loss, because everybody knew that Beta is technically superior in
compare to VHS.
Situation with 680xx and i86x CPU's is similar...

Look what happened with all non-standard interfaces, drives, connectors, peripherals - all disappeared.
Everyone who wanted making monopoly failed. And that's the real life - healty competition.

I don't use a cache tool with CAB 2.7. Just click down on the file
to be downloaded and make sure that you hold down the mouse button
for a second or so and the File Selector appears.

Sometimes it comes up with the "Binary file" page in which case
click on "Back" and try again.

Hope that helps.

Peter

The SLM 804 was based on a TEC printer IIRC, so it ought to be possible to
track down a supplier.

>directory, asking for a program to run?

This is usually MagiC asking you for the path to the desktop program,
although a missing/faulty path statement in your magx.inf file doesn't seem
to be the cause of your particular problem.

I'd suggest adding the line

;#_TSL <non-preemptive>

to your magx.inf file. This will turn preemptive m/tasking off, and will
allow all your auto loading files to properly initialise in turn. Load up
the timeslice CPX and turn preemptive m/tasking on there, save the
settings, and make sure that the CPX gets loaded each time.

I use Holger Weets' Finder, presumably still registerable from the author (now that InterActive isn't). SuJi also works very well - it's supplied with jinnee V2, and best of all it's freeware. English version from my website.

Hi Pera

>But it's not the point. Why prevent people from using obsolete software,

Its not obsolete, its still in use, i'm using it right now.

>what is for many years not distributed?

I bought one not so long ago, a TOS 3.06 in fact, from a licenced re-seller..

>Who will have any loss from it?

The owners, and ultimatley the future owners/users. Its only a viable product if the owners can make money on it and it pirate users like yourself just go out and steal it to order then it does not give them the confidence to develop it any further, isnt that why there is no further development of Atari software. Ultimately you yourslef are responsible for it being 'obsolete', you are removing the profit from the owner who in the end are doing this /only/ to make money. In short youve created its obsolecence youself by advovating its theft.

>If something is not buyable you have two choice

It is still buyable.

> (now with Internet) : to not have it, or to download it.

Steal it you mean!!. remind me to keep an eye on you if you visit my neighbourhood.

Actually i want an Aston martin, as i cant afford it i'l steal one, is that OK with the likes of you. Would that suit an Aston owner in here, for me to steal yours because i cant be arsed to buy one.

>Why copyright holder of TOS doesn't have WEBsite, where you can legally
>buy it?

The copyright holder has never sold it as an aftermarket product, theyve always relied on licensed re-sellers.

> I'm sure that reason is simple: they are not interested, because traffic
>will be too little.

They are not interested coz they are a massive corporation who dont interface with consumers, relying on authourised service personel to do things for them. You wouldnt go to Shell head office for oil would you!!

Oh well the goes the easy solution.

Perhaps the file got corrupted? Did you load a freash copy from your floppy?
Did anything different to your falcon between the last time you ran ZeroX?

Sorry for the obvious questions (ones that you more than likely already took
care of)

Cart port damaged?

Poor digital clock signal (but that shouldn't freeze the program)

What version of ZeroX are you using?

Missing RSC file.

I tried one once, in fact. It only worked on an A500 with 1MB RAM and two floppy-drives (and UAE, but that's another story).

It was slow and jerky. I did get a pinball-game to work on it, though.

Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech,comp.sys.atari.st,de.comp.sys.atari,comp.sys.atari.advocacy, maus.computer.atari.falcon

Hello,

I search of documentation on the structures of file RSC. I created a program to extract the icones from 2 to 256 colors of the files Windows ICO and CUR (files DLL, EXE and OCX in progress). I would like to record them in a file RSC with format CICON. The documentation which I have (Compendium, Atari developor divides into volumes 1 and 2) are a little light on this subject. I saw well the structure RSHDR in PURE C, but no documentation on the pointers of objects. I believed to understand that there was a file RSCREATE.C which would seem well to answer my request. Can you help me to find it. Thank you by advance.

>Of course, instead of BigDOS, you may use MagiC to get onto a big part
>like that.

MagiC isn't the only OS that allows you to use big partitions. FreeMiNT
1.15.5 can do this as well.

FreeMiNT 1.15 has a new FAT filesystem. It is integrated
in the kernel.

The NEWFATFS has many advantages:
- very fast
- mostly configurable also on runtime
- supports Microsofts VFAT extension
- supports TOS and DOS partitions of any size
- supports FAT32 partitions;
partitions larger than 2 GB are no longer a problem
- part of FreeMiNT, available in source for easy support

Hi,
It should be fixed now, thanks for the bug report.

>

Thanks for God that there is at least 2 people on this corrupted planet,
which care about this.
Yes, you are in right. But it is only theory, and empty talking. Real
World works little different...

Go, and fight against sites, FTP-s, BBS-s which offers free download of
TOS.

As I see copyright holder (who is it btw. ?) cares not much about it.

Don't you think that it's little absurd that people share Atari ST's for
free, and we talk about illegal usage of their 10-15 year old OS ?

Fact is that Atari and Digital Research are dead now. I think that perhaps
it wouldn't happen if they were worked more hard and realised more of their
promises. You may download older Apple OS-s on their WEBsite for free, and
Apple is still alive ! How is it possible ???

And I think that we should turn to future, and new projects, instead such
in fact theoretically discussions.

For example Linux is freeware OS, currently in great expansion. What you
think about worth of it in compare to 10 year old TOS ?

3606. Some Atari 520STfm Questions

Newsgroup: comp.sys.atari.st
Date: 2000-03-16 00:00:00 UTC
From: William Sayers <william@sayersw.freeserve.co.uk>
Message-ID: <8arc2i$fg9$1@newsg2.svr.pol.co.uk>
Source record: 64392

Hi,
I recently acquired an Atari 520ST for £3.99. I have hooked it up to a TV
and it seems to run OK. What I want to know is:

1) Is it possible to hook it up to an old 120MB IDE Quantum Fireball HD I
have knocking around?

2) I have got some old speakers knocking around and I know I can connect
these to the correct plugs
for the atari speaker (not MIDI as far as I know) ports around the back,
Would this be worth it?

3) Can anyone point me in the direction to download a program allowing
serial cable link between
my 486 PC (Hey, It's not modern but I'm 16 and it only cost £40) and my
Atari?

4) Where are the best places to find Atari compatible hardware (Like mice,
It didn't come with one and my finger gets tired
holding down the "Alternative" key) in the UK?

William Sayers

3607. Atari Mags and disks

Newsgroup: comp.sys.atari.st
Date: 2000-03-16 00:00:00 UTC
From: Phil Young <philyoung@myself.com>
Message-ID: <SobA4.1126$Fy1.20461@news2-win.server.ntlworld.com>
Source record: 64393

I'm clearing out my old Atari mags and disks.
The below are available (with most coverdisks - all catalogued!!) to whoever wants them and is willing to pay postage (UK only) or collect, plus 10 quid from the disk box! (Sliding draw).

ST Action.
Below Issues from between June 1990 and Feb 1993:
26, 34-39, 41-58 (25 mags)

ST User.
Below Issues from between March 1991 and Jan 1994:
61, 64, 68, 70-72, 75, 83-88, 90-96 (20 mags)

ST Format.
Below Issues from between June 1991 and Oct 1995:
23, 31-38, 67-75 (18 mags)

ST Review.
Below Issues from between Aug 1992 and Jan 1995
4-14, 17, 23-35, 27, 30, 32-35 (21 mags)

If you are interested, send me an email.

Phil

Message-ID: <38d17af0$0$16857@news.zetnet.co.uk>
Source record: 64256

May I respectfully remind Atarians that there is a difference between
C:/ partition and c:/ partition?

Upper case C refers to the harddrive (internal or external).
Lower case c refers to an attached DMA cartridge (though I've never
come across one).

I don't know if this means much if there's no attached cartridge,
but it is helpful to use the official designations (I think).

>>disappeared immediately I switched it off - weird!
>
>That's odd. Most modern program can handle long filenames without any
>hassle. What were the problems?

It was some time ago but from memory... "show info." this was showing
crazy figures, eg partition size 750Mb - on a 350Mb hard drive?! Files
sizes were like telephone numbers. When I tried optimising I had 100's
of "wrong name" files, corrupted files, corrupted file names, "locked"
files and folders, by that I mean they could not be deleted.

I transferred what files I could to other partitions and reformatted the
main problem partition. When I transferred the files back the same thing
happened again and I realised then it was only happening on long file name
partitions. I took this off and rebooted intending to going through the
reformat procedure again only to find that everything was back to normal
and I didn't need to.

> have knocking around?

Yes, but if it's a 3.5" drive, it's not very practical. There are IDE
adapter boards, but they are intended primarily for internal 2.5" drives.
They will work with 3.5" drives, but these require more power, and take up
more room, so fitting them inside the case with the standard PSU might be
problematic. There are also SCSI adapters, mainly intended for external
units. This is all covered in the Quick FAQ.

> 2) I have got some old speakers knocking around and I know I can connect

> for the atari speaker (not MIDI as far as I know) ports around the back,
> Would this be worth it?

Yes, but depending on the TV you are using and the speakers. If you are
using crappy old PC speakers and a huge Nicam stereo TV, then you certainly
won't get any advantage.

MIDI does not carry sound. The MIDI ports are a kind of specialized serial
port connection for communication with musical instruments, NOT producing
sound.

> 3) Can anyone point me in the direction to download a program allowing
> serial cable link between
> my 486 PC (Hey, It's not modern but I'm 16 and it only cost 40) and my

Yes, there are several. Pointers in the Quick FAQ.

> It didn't come with one and my finger gets tired
> holding down the "Alternative" key) in the UK?

In the UK, Systems Solutions, Titan, and maybe a few others. There are PC
mouse adapters. This is also in the Quick FAQ.

A PS2 mouse is just a rewired serial mouse, right? If so then you there is
info about these in the Quick FAQ.

PS2 mouse uses different voltage levels than serial mouse. It works at
standard 5V , while serial works at around -10V. However A4 Tech sales their
PS/2 mouses with some adapter, so they can be attached to serial port.

displaying a
: >greyscale image...
:
: Now you're just splitting hairs, the only /true/ mono monitors
were of the
: TTL type such as used with the amstrad CPC64, so called amber
and green
: screens.
:
: The term monochrome is used in the industry to specify the
difference
: between black and white and colour systems rather than between
greyscale
: and duochrome, and it is not a technical specification..

Monochrome versus greyscale has to do with the ability to show either on/off pixels or pixels that can tone from black, to dark grey, to light grey, to white. This toning can be of different resolution, 4, 16, 128, 256 or whatever "steps" of grey for any given pixel.

The SM124 is a true monochrome monitor. It can though, with extensive work, be converted to do greyscales. This was demonstrated years ago in a german magazine. The idea was to be able to also display low and medium resolution on it, in greyscale.

I suppose it's a question of respect for others and the feeling that
on the whole it is better not to steal or break the law. Of course,
this is not 100% and I doubt, for instance, if there are any
motorists who can say that they have never broken a speed limit. But
if everyone steals what they want, life would be very unpleasant.
It's bad enough when even a minority steal.

The Amstrad CPC monitor was actually a "greenscale", as it was perfectly
capable of displaying the Amstrad low res in 16 shades of green. I have some
fond memories of one of these.

ah, yes. But, since you are such an expert on the workings of the
sinclap Random String Generator (to be referred upon as the sRSG), maybe
you can answer some questions I have on it:

1) years ago, it was being referred to here as the sinclap Random
Bull**** Generator. Is the sRSG an improvement upon the older sRBSG, or
is it a completely different program from the older program? If so, what
improvements have you noticed being done between the original and the
one we see today?

2) it's been rumoured that the sRSG is running off a Macintosh
computer. Why would anyone program an application of so non-existant
importance for a respected platform like the Mac? And is it true that
previously it was designed to run on an Amiga?

3) about two years ago, the sRSG began suddenly spouting out nonsense
attacking a supposedly portly individual called "Chunks". Since this
said "Chunks" has been proven not to exist (he is certainly not on the
rolls of TAF), what variable could have caused the sRSG to mutate itself
to generate attack strings against an imaginary individual?
Is it a mutation of a similar bug in which it claims that imaginary
"Atari Jihads" are "out to get it"?

4) what about these rumours I'm hearing that the sRSG is actually a
subset of an even larger program called the Steve Jobs
Reality-Distortion Field (tm), being run from a large NeXT machine in
the basement of an anonymous building in Cupertino, California, USA. Is
the sRSG affected whenever the SJR-DF program crashes, or when the main

program spouts out similar larger amounts of gibberish that have an effect over a wider area of the population?

5) the sRSG seems to have a problem when it generates its messages in that it is unable to piece together coherent sentences, and mangles the spellings of common everyday words. What are the chances that this obviously glaring flaw can be fixed?

6) the sRSG has taken to pulling articles from web sites and pasting them (badly formatted) on USENet groups. I notice recently that whenever a Canadian replies to it, it has been pulling articles from the National Post website to say how bad we have it in our country. We suspect that the website (and indeed the hardcopy editions) are being polluted by the "Tubby Black" virus. Could the TB virus be a mutation of the sRSG in larger form, and is the sRSG be itself a worm virus? Why has the sRSG been so attracted to the NP website, especially in light of the fact that the other Canadian newsites which have not been affected by the TB virus have been reporting the exact opposite? (We also find it interesting that the NP web site has not reported that a certain newspaper baron much unbeloved in this country recently had his lawsuit against our repected PM thrown out of court, and that indeed it has once again gone to new heights of screeching against the PM - symptoms eerily similar to the sRSG in dealing with any USEnet posts that contain the word "Atari" or "TOS")

I await your respected opinions on the above queries.

Hi,

I've been following this discussion with interest. Sure, one can
always say "copyright stuff, illegal, whatever".

I think Pera does have a point. Why? First of, what is TOS? TOS part
was GEM. Didn't they release the GEM code sometime ago?
Next parts are Atari's. Nope, they're Hasbro's, aren't they?
Let's try to figure this puzzle out.
Atari once sold TOS. With their machines that is. No choice. (the ones
arguing about MS pushing their own products with every PC should
reconsider here...) So with every sold machine, they received
copyright money. Apart from that, they produced updated TOS. They also
sold these, so they received copyright money again. I don't think the
Atari warehouses did contain much stuff left when they vanished/went
bankrupt. And if there were leftovers, they were sold too.
BTW, how many illegal TOS versions you think do circulate? I know in
the late 80's and early 90's there were lotsa people "burning" updated
TOS-es for friends, other members of the clubs, etc. etc. At least in
Holland this was common practise. Should Holland have been the only
country where this happened? :-))))))
Now let's get back to 2000. Atari no longer exists. Hasbro is said to
own the rights. Do they care about Atari users? Should they expect TOS
copyright money for stuff they cannot even deliver?

Can we still buy TOS? Not with Atari or Hasbro. If you're lucky some
dealer has still some dust-covered ROM's lying around (for which
copyright has been paid already).
We're not talking about the latest versions for the Milan stuff, and
these have nothing to do with the whole issue, IMO.

Now let's face the situation: some emulators that need a TOS-image
(they don't even work on the TOS ROM's). So? Problems? Illegal?

Uwe, I read you. But, from the day you'd stop making/selling HD
Driver, there are no more copies at the dealers and one new user
asking around for it, I wouln't hesitate to create a copy of my own
version for him.
There IS a difference...

Hi Hallvard,

On 15 Mar 2000 23:39:06 , Hallvard Tangeraas wrote:
>Checked the dongle? Follow my Notator FAQ (the Notator mailing list
>site, URL in my signature below) where you'll read about problems with
>it due to bad contact.

Yep checked out the FAQ and mailing list a while back - thanks for all
your work with this - and found my cartridge port contacts were getting
worn (after sending my dongle back and checked out ok!) so changed it
which helped a lot.

I, like a lot of Notator users don't use many if any ACC's when running
it as it's a great but tempremental beast :-) This imho is the one thing
Cubase seems to have over Notator - the dongle and it's strict timing.
But I think because I'd always used Notator I can't seem to bring myself
to change over to Cubase...which I'm sure is the same situation for Cubase
users in reverse.

Best Wishes
Sean

Hi!

In article <38d17af0$0$16857@news.zetnet.co.uk>,
cstanley@zetnet.co.uk (Charles Stanley) writes:
> May I respectfully remind Atarians that there is a difference between
> C:/ partition and c:/ partition?

But that's only a feature of the ROM desktop, it will treat c: and C:
differently when opening a window - GEMDOS itself doesn't distinguish
between upper and lower case driver letters, not even for C.

Ciao

Thomas

> one we see today?

Well-observed. You're absolutely right. Several years ago it
carried the title of BS generator, but since it is evidently
also capable of generating sentences of extreme hilarity (for
their pointless views and mis-interpretation of everything),
it's more appropriate to describe it as a random *string*
generator. Those strings may, of course, also contain character
and word combinations that when interpreted according to a
particular set of language rules, means plain ol' BS. They may
even produce beautiful music if loaded into a sample player
(see Danny McAleer's "Audio ABCs" article in Atari Computing
issue 4, page 21).

This is a close analogy to the theory that a group of monkeys
with typewriters and infinite time, could produce the entire
works of Shakespeare. They would also produce lots of BS and lots
of instances of "Atari" and "TOS" but not necessarily in a construct
of any meaning.

To summarise the principal differences between the old sinclap
BSG and new RSG is simple: The new version is multi-threading,
for those really wicked pranksters with high-end workstations,
and in terms of its functioning, it has developed a large degree
of artificial stupidity.

> 2) it's been rumoured that the sRSG is running off a Macintosh
> computer. Why would anyone program an application of so non-existant
> importance for a respected platform like the Mac? And is it true that

> previously it was designed to run on an Amiga?

The sinclap algorithm was originally developed at Berlin Technical
University by a doctor whose name escapes me at this moment. Like
any logical algorithm, it may be adapted to execute on any digital
computation system, so modern computers are an ideal hosting
environment to thrash the sinclap String Engine (not to be confused
with Sony's PlayStation 2 Emotion Engine, an infinitely more exciting
and useful thing).

Like a virus, the sRSG got to spread and evolve/reproduce in many ways.
Some are malicious, some are purely academic (it's one of the UK's top 3
Computer Science final year project studies, and one hardcore German
computer magazine even published C sources so readers could program their
very own sinclap Random String Generator).

So the sRSG exists on many platforms, and perversely, with Apple's
new super-duper G4 "Supercomputer" machines, its high CPU demand
makes it an ideal benchmark for the latest generation of high
performance microprocessor cores. Some old benchmarking programs
would suffer severe internal integer/FP overflow when executed
on new CPUs and MPP (Massively Parallel Processing) arrays. It would
be interesting to see how the score of 3.2 sinclaps on a 500MHz G4
would compare to the million-processor research machine currently
in development at IBM. It could well smash the magical 1 TERASLOPS
(trillion SincLap Operations Per Second) barrier, not accounting
for compiler optimisations.

Pure co-incidence that the random output at that time appeared to
have a negative bias towards the imaginary "Chunks".

> Is it a mutation of a similar bug in which it claims that imaginary
> "Atari Jihads" are "out to get it"?

Not a bug at all, see above.

> effect over a wider area of the population?

No. A larger and more processor-intensive program than sinclap RSG
could not possibly run at a sensible speed on those NeXT boxes,
unless someone has worked out a way for it to invade and multiply

on networks, and be able to pass parameters between processors
without consuming so much network bandwidth with its remote
process initialisation that it becomes even slower to run it on
distributed processors.

Actually recently shipped.
Tried installing it. No problems with the hardware. Everything boots up
ok (on standard video port). Can't get fVDI to initialise Eclipse yet.
Get some error messages which I don't understand. I sometimes think
error messages are written by the same people who write puzzles, they're
usually completely opaque ;>).

>
>What sort of features and what sort of problems?

I'm talking about freedom 2.05. Freedom 1.15 is more stable but with MiNT
(and maybe other systems too) it get killed after it has been called for
the x-time. I don't remember the right numbers but I thought it was
somewhere around the 36 calls.

Features: -The history of the last 200 selected files is very handy.
-One can define the colors of different file types
-One can Drag and Drop a file from inside Freedom to an
application.
-Powerfull search option
-Up to 7 nonmodale selectors open
-One can view pictures from inside the selector
-Etc....

Problems:
For instance with Okami I can't import/export messages when I'm inside
Okami. If I do the whole system goes crazy. Without Freedom I can use that
options without any problem.
Furthermore on my system the loading order of freedom2.acc seems to be
very important. If loaded in the wrong order freedom will mess around with
the system colors when I call freedom's own cpx control panel.
On computers without DMA-sound (like the Hades) you'll find that you must
patch Liberty in order to use GEMJING.

Hmm, any change you've used Diamond Edge to optimise your harddisk?
Diamand Edge can't handle long file names at all. If you use it on a VFAT
partition it will destroy that partition.

This is a great game. If you are keeping your Atari, and want to use this game on it, there is a fix called "Railroad Tycoon" surprisingly enough.

It allows you to reset your computer to 1meg and was released by the distributors on many magazine cover disks. If you require it, I can email it to you if no one else has.

Brian.

True and bear in mind how many people have joined c.s.a.st by simply keying Atari in the newgroup listing. We don't know how many 'lurkers' there are who enjoy reading the postings but don't necessarily want to join in.

If you have a mailing list won't it become exclusive purely because no one will necessarily know of it's existence unless they ask a question on c.s.a.st and get pointed in the right direction?

Just a thought.

No, a cartridge for the ROM-port. TOS looks for a special code in
some ROM-port mapped adresses. If found then all following startup is
done from software in de cartridge.
That way you could make game-cartridges for the ST.
Also is it possible to have partition c:/ with files in Eprom in
cartridge (read only). I do not know if auto-folder is possible.

Someone knows?

Message-ID: <38D38B62.72AF5C4B@sidra.si>
Source record: 64292
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Not true. PS2 mouse uses different voltages (TTL) and different communication protocol than
COMport mouse. In fact, PS2 mouse behaves almost exactly the same as the standard keyboard.
Some mices have smarter controller chip which can do both protocols, but definitely not all.
My old Logitech Pilot for serial port does not like PS/2 adapter...
In order to properly connect PS/2 mice to ATARI ST one would have to redesign interface.
If one chooses to use for the job microcontroller like PIC16F84 then it would be quite simple
to do the PCB board for it, and only headache would be writing the machine code for the microcontroller.

Regards,

Branko.

Source record: 64294

Hello all,

I have changed the subject of this thread (formerly about HP Deskjet600 and Pagestream 2.2). The source code for all the Pagestream 2.2 modules and drivers is available from the Umich archives but it is all in assembly language. I have NO experience with this, however looking at the drivers, I see where the codes to allow the printing of A4 pages needs to be inserted.

Where can I download an assembler or is there some kind soul out there who might volunteer to make the necessary changes? ;-)

Terence, thanks for the small C prog to change defaults, however this is not a feature supported by Deskjets =(However, now that the sources are available for all the Pagestream drivers, perhaps some people might like to create new ones for newer printers. Certainly the A4 page problem is very easily fixed here...

(remeber that Pagestream 2.2SE is available from SoftLogik for a song now ;-)

Thanks in advance for any help anyone can offer!

3649. help w/ hard drive

Newsgroup: comp.sys.atari.st
Date: 2000-03-18 00:00:00 UTC
From: dzander@solaria.sol.net
Message-ID: <38d3cd17$0$87706@news.sol.net>
Source record: 64295

Hello, I have a problem with my hard drive. I have an 520ST with tos 1.4
(Rainbow tos) and 720Meg harddrive with partitions C thru J. My boot drive
is the C: partition with a whole bunch of auto programs in the auto folder,
including "TOS14FIX.PRG","POOLFIX3.PRG","CACHEXXX.PRG","FOLDERXXX.PRG" as
well as some fix for the serial port called "HSMODEM6.PRG" IIRC.
Originally, I had the order correct for all the programs in the auto folder
but then I copied them all out of the auto folder and erased all the
programs in the auto folder and then copied them all back into the auto
folder. Unfortunately, I failed to copy them back in in the correct order.
The drive boots and the desktop appears with all the disk icons but then
the mouse appears as a busybee and the C partition window doesn't appear.
I cannot get control of the computer and the mouse stays as a busybee.
As the harddrive boots I see all the messages from the auto programs and
one of them says "use xxxx to fix!" but I forget what it says.
My question is, is it possible to boot up the system without running any of
the programs in the C drive's auto folder? If I was able to do that, then
I believe I could rearrange the order of the programs and correct
everything. I do not want to reformat or lose any data on my harddrive.
Thanks for any help.

I reckon an atari-music newsgroup would be popular and long overdue.
Due to the supposed lengthy process of starting a new newgroup I have
been throwing around a rather cheeky idea:

WHY DON'T WE USE AN EXISTING NEWSGROUP??? Obviously one that has no
traffic, and I believe there are plenty of those.
ie. make a defunct Newsgroup functional again.
Obviously, the name of the newsgroup would be inappropiate. Maybe
the name could be changed in time.

I suggest comp.sys.atari announce

i would be interested in any responses to this.

This is true, mailing lists are by their nature exclusive. I reckon
a newsgroup ans a mailing list together would be the best solution

Cheers, Simon.

More modern TOSs you can hold down CONTROL when booting. I have a
feeling you can't do that with 1.4 but what you can do is have a
floppy with a hard drive boot program in drive A and press ALT
whenever the drive access light goes on during boot. This will boot
from floppy. Then install a drive called C and you should be able to
open it.

like you I was equally shocked about what happened to Kellis' web page. I am glad, though that Bengy Collins (who the scumbags had left his URL for MagiC Online on the hacked page) has made clear he does not condone or support what these idiots did. Who would have thought that some Atarians would have stooped to sinclap's level?

I'd suggest that when her page is back up that we send letters of support for her, to show that there are people in this community who do care about her page and what she's done in her support of the platform.

I agree totally. This is one area where I never minded the atari
community not being up to date.

The really lame bit about this is that unlike people that hack a
companies web site etc, is that kellis had no control over the security in
use the web site. It was simply what the ISP provided. There are lots of
areas in the world where people are lucky enough to have a local ISP let
alone one that has up to date and modern security.

This ranks up there with locking people out of #atari on irc. Oh
exiciting! What's the f***ing point.

```
CAB.OVL 1.4002

binary update available now at
http://www.netset.com/~baldrick/

Changes:

Authentification now aborts if too many failures on the same
document.

Patch for handling servers that just return html files instead of
http headers. (This seems to have been part of the problem at least with
the connection reset crashes)

3664. help w/ hard disk

Newsgroup: comp.sys.atari.st
Date: 2000-03-18 00:00:00 UTC
From: dzander@solaria.sol.net
Message-ID: <38d42d8e$0$40289@news.sol.net>
Source record: 64310

This didn't seem to get posted the first time so I am trying again.

I own a 520ST TOS 1.4 (Rainbow Tos) with 720Megs hard drive partitioned into C thru J partitions. My C part holds an auto folder that used to work properly. The auto folder held several programs such as FOLDERXXX.PRG, CACHEXXX.PRG, TOS14FIX.PRG, plus a program for high speed serial fix.
Now the thing is that everything was working until I copied everything OUT of the auto folder and then ERASED the contents and then copied everything BACK INTO the auto folder but unfortunately I failed to copy them in the correct order. Now my HD boots up and I get the disk icons but the mouse just shows as a BUSYBEE and I cannot open any windows.
My question is, is there a way I can boot the hard drive without reading any of the programs in the C:\auto folder? If I can get control of the hard drive I should be able to rearrange the order of the auto folder and it will run correctly again. Is this what it means to make the A drive as the boot disk? Is that what I have to do? Any help and advise?
Thanks for any help.

3665. Re: TOS2.x

Newsgroup: comp.sys.atari.st
Date: 2000-03-18 00:00:00 UTC
From: Martin Graiter <graiter@starmail.com>
Message-ID: <8b19rc$s94$3@cubacola.tninet.se>
Source record: 64311

The question of copying the TOS is a multiple one.

1. What says the law? And which law applies?

2. What is moral/immoral?

3. If someone gains, will someone loose?

The laws in different countries differ here. In Sweden copyright is valid even if the holder is "gone". Theoretically the State can assume the role of the copyright holder and meter out fines/prison terms for copyright violations. This have never happened in a case similar to the frivoluos use of the TOS. In fact, this have happened in only one very inflamed and murky case: The publishing of the Swedish translation of Adolf Hitler's book "Mein Kampf".

The Free State of Bavaria claims to be the owner of the copyright of this book, but it is not really clear that this claim is valid. The book is available since long in Sweden, but the recent print was a cheap paperback edition "which would spread the ideas of Nazism to the masses" according to one state official...

As mentioned, this is the only case in which the State has chosen to apply the copyright laws in the strict sense. It is reasonable to assume that other considerations than economic led to the decision to forbid the sale of this book.

A copy of TOS 2.06 could hardly be expected to stir up the same feelings?

There is a way, according to swedish law, to make and sell copies legally though. If you change the content in any way, then this is considered to be another work and eludes the copyright laws.

There is also another, very important, factor. If you are making just a few copies or are engaged in "industrial" quantities. The law doesn't make this distinction in it's text, but the spirit of it does.

There is a collision here between the very foundation of Roman Law (which is the basis for all Western laws), the right of ownership, and the copyright laws. The copyright law cannot (in principle) be applied to copying which is small-scale and doesn't in a significant way economically tax the copyright

holder. And we're talking on a per case basis. So even if 50.000 atarians would make one copy each of any single software and give it away to one friend each, and this would *imply* a "loss" for the copyright holder, the whole case would judicially be partitioned into 50.000 separate cases, and each one would be a contest between the right of ownership and the copyright. And in each case the right of ownership would win.

There is a very good reason for the authorities to NOT prosecute anyone copying pages from books, or TOS images. The case can't be won. And the "damage" it would do, by telling the world that it is OK to copy and give away/sell your property in small scale would be worse than any percepted loss from the part of the copyright holder.

Question two here, what is moral or immoral must be seen in light of the above. Just as much speaks for the fact that wildly copied and propagated software boosts sales, as the opposite, that it kills off software producers.

The third question, of communicating carils, isn't clear either. The mere hamstering of a software doesn't automatically imply that every copied disk is a disk that would have been sold. It is more likely that it would instead have collected dust.

There is also no necessary correlation between the amount of pirate copying and prices on software. Exept maybe that if prices were low enough, it wouldn't pay to pirate them?

Conclusion:

You have the right to use your property in any way you like, even sell or give away copies of it. If the economic weight of this copying is such that it attracts the attention of the copyright holder or the Law, then prepare to pay for that.

>(Rainbow tos) and 720Meg harddrive with partitions C thru J.
>My boot drive is the C: partition with a whole bunch of auto programs in
>the auto folder, including

>"TOS14FIX.PRG","POOLFIX3.PRG","CACHEXXX.PRG","FOLDERXXX.PRG" as well as
>some fix for the serial port called "HSMODEM6.PRG" IIRC.

You dont make it obvious but do you realise that the XXX in the cache and folder prog's need to be substituted with with the number of extra folders reqd in the case of FOLDR, eg FOLDR200.PRG, and the number of cache blocks rqd, i think its in blocks of 256 bytes eg, cache64.prg.
Its been a while since i've used this bunch of prg, but if i had to start with them i'd pick the order..

FOLDR200.PRG
CACHE64.PRG
TOS14FIX.PRG
POOLFIX3.PRG
HSMODEM6.PRG

Good question Jorgen, the icon in question is a construct of horizontal
lines to the left of each Hotlist entry, which can be set and cleared with
the mouse. What's its purpose?

Steve Sweet <steve@sweet3.freeserve.co.uk> skrev:
: Hi Pera

:>But it's not the point. Why prevent people from using obsolete software,

: Its not obsolete, its still in use, i'm using it right now.

I'd say that version 2.x is obsolete, since it not only is stone-age
technology-wise, but has also been superceded by two major revisions.

:>what is for many years not distributed?

: I bought one not so long ago, a TOS 3.06 in fact, from a licenced re-
: seller..

I'm certain that Hasbro became any richer, too.

:>Who will have any loss from it?

: The owners, and ultimatley the future owners/users. Its only a viable
: product if the owners can make money on it and it pirate users like
: yourself just go out and steal it to order then it does not give them the
: confidence to develop it any further, isnt that why there is no further
: development of Atari software. Ultimately you yourslef are responsible for
: it being 'obsolete', you are removing the profit from the owner who in the
: end are doing this /only/ to make money. In short youve created its
: obsolecence youself by advovating its theft.

The owners don't care about it. The owners haven't done any development in
five years. Tos 2.x has been out of development since before that. Atari
themselves made TOS 2.x obsolete when they stopped producing the STs and
went for the TTs and Falcons. As has earlier been stated, older versions
of MacOS may be downloaded for free from Apple's sites, and I found
AmigaOS 3.0 on last months Amiga Format CD.
Hasbro has in no way profited from its TOS rights, and has not made a
single move towards gaining any profit. As far as it is concerned, it
hasn't got any TOS or ST architecture, but only a collection of
20-year-old arcade games.
Any pirating of TOS will do Hasbro no harm, and will make TOS 2 no more
obsolete. If anything, it will make TOS 2 a more vital OS, since it will
run on more machines.

:>If something is not buyable you have two choice

: It is still buyable.

Yes, but why bother? It's an unsupported product, and buying one new would
be as useful to any party as buying an old STE only to cannibalise it for
its ROMs. The only winner would be the retailer, and frankly, I think
that the TOS money would be more useful if it were put towards buying some
new software which is actually still supported and developed.

:> (now with Internet) : to not have it, or to download it.

: Steal it you mean!!. remind me to keep an eye on you if you visit my
: neighbourhood.

Steal it? It's rather akin to "stealing" out of a rich man's dustbin.

: Actually i want an Aston martin, as i cant afford it i'l steal one, is that
: OK with the likes of you. Would that suit an Aston owner in here, for me to
: steal yours because i cant be arsed to buy one.

No, but if I happened to find an abandoned, outdated Aston Martin while
driving around in my old VW beetle, why not pick it up? No-one'd miss it.

The fact of the matter is, that no-one is going to steal your TOS ROMs.
They will remain firmly in their sockets.

:>Why copyright holder of TOS doesn't have WEBsite, where you can legally
:>buy it?

: The copyright holder has never sold it as an aftermarket product, theyve
: always relied on licensed re-sellers.

The current copyright holder hasn't relied on any-one, and I doubt that
there are Hasbro-licenced TOS resellers.

:> I'm sure that reason is simple: they are not interested, because traffic
:>will be too little.

: They are not interested coz they are a massive corporation who dont
: interface with consumers, relying on authourised service personel to do
: things for them. You wouldnt go to Shell head office for oil would you!!

They are not interested because they are ignorant and probably aren't
even aware of their having it.

Thanks for the info Peter! As I have mentioned in another thread, the driver source code is available from Umich in Assembler. If I had access to someone with an assembler or knew where to get one I could make the necessary modifications myself. It is really quite straightforward. The code is very logicaly laid out, and all the printer codes are commented at the end of the file.

Thanks again, Jerry

3677. Re: Micq 4.4 for STiK API patch 3

Newsgroup: comp.sys.atari.st
Date: 2000-03-19 00:00:00 UTC
From: baldrick@dilbert.netset.com
Message-ID: <38d5739e$1_2@athena.netset.com>
Source record: 64201

Well out of the blue, I ran into the Micq author on icq. We found
the problem with the contact list. So patch 4 is up on my site.

If you didn't get patch 3, don't worry about it. Patch 4 is the
same except for the fixed contact list.

Hopefully this is the last of the problems with this port.

FE> I can't seem to find the MegaSTe/TT030/Falcon030 models on eBay; any
FE> other on-line auctions I could try?

You may be interested in my Mega 4 STe.

The time has come for a new owner for the Bear Cavern BBS's equipment.

The following Atari equipment and software are for sale for $500 plus
handling and shipping.

Optional: Will include an APC BackUPs 400 UPS for an additional $40 plus
handling and shipping.

1 Atari Mega 4 STe equipt with 50 MB hard drive, Ajax chip, 1.44 floppy
drive. With a JinMouse (better than an Atari Mouse).

1 Atari 14" swivel base monochrome monitors.

1 Atari SC1224 color monitor.

1 1.1 Gigabit Seagate SCSI Toad Tower Hard Drive with Adaptic card.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
This hard drive is the one used with the BBS and contains several hundred
Atari, MSDOS and Windows files.

1 540 MB Quantum hard drive with an ICD II adapter.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
Built in the same box, a 750 kb floppy drive. The floppy is good but the
cord length makes it unreliable. Best to remove it and use it as intended.

The BBS software is BB/ST by Quantum Microsystems. Old but reliable.
The program has been improved by Anthony Watson (Mountain Software),
improving the file library and the File attached Mail.

Maintenance software on the BBS includes, Diamond Edge, Diamond Back, ICD Pro
Utilities, SCSIWAIT 3.

Two external SupraFAXmodems, 1 v32.bis and the other 33.6 (these are the ones
with the display)

Dozens, if not hundreds of 750 kb disks with commercial software, Magazine
files, and STReports downloads and manuals. (Also the Best Electronics
catalog).

Cords, powered monitor switch (will switch from one monitor to another
including the AC)

Mega STe Field Manual

Lots of software

I looked at both systems before I left the 8-bit world and
Atari was what I picked. I've seen 040 Amiga's also and
well the one I seen cannot even play mp3 as good as my
Falcon. So some old game on an emu is fair judgement?

I think not.

From what I have read in Atari magazines most are happy with the Atari
STfm and Falcons with the Cubase software. But with a lot of PD's with
various midi music programs available, you should have no trouble
contacting the developers for advise.

I used SELECTRIC for a long time, and had no trouble under MagiC 5 since I don't use long filenames. The only thing that was annoying about it was that if you changed resolutions, SELCTRIC disappeared, and was replaced by MagiC's built in selector. :^(

I tried Boxkite, and liked some of it's features, but to me it seems _ V E R Y S L O W _, especially in 256 or TC resolutions (I'm referring to the screen redraw speed in case anyone is confused here). Selectric was always very quick, and therefore I've gone back to it now.

Hi

It looks like Atari.org's redirect isn't working:(

I hope this is not a new vandalism activity that will be taking over where
the virus fails.

It can take a lot of effort to get a web site up and running, along with the
maintence and time researching, and something along this nature must really
hit Kellis.

Although I don't use multitasking at the present, I will be giving it a go,
I do appreciate the contribution of the true Atari user to the Atari/TOS
platform. So didn't give up, there are more for you than against:)

Why!

You can always boot from a floppy. This floppy can contain an auto folder with the proper programs, for instance a hd-driver... Once your on your desktop you can change the order of the auto folder on C: with a program like 'Autosort'.

Once you've fixed it you could consider installation of a bootmanager... there are a lot of free- and shareware bootmanagers. They can help you with picking the right auto folder programs to load and also to change the order of those programs.

Greetings,

3690. PageStream 2.2SE Questions

Newsgroup: comp.sys.atari.st
Date: 2000-03-19 00:00:00 UTC
From: jtmartin@gofree.indigo.ie
Message-ID: <4Y3B4.1013$RC3.663@news.indigo.ie>
Source record: 64324

Hi All!

I posted a message about the pagestream drivers being available as source code, but I don't know if it appeared here?

Anyway, regarding printout to modern HP Deskjet pinters -- it is possible, and quite simple to modify the driver files with the approprate printer codes to allow printout to an A4 page. However, I need an assembler or some kind sould who might volunteer to make the changes. Is there anywhere where I can download an assembler for Atari? (The source code for the drivers and all modules is in assembler and is available on Umich)

My second question regards the supplied spelling dictionary. With 2.2SE only the US dictionary is supplied. I know that there is a UK version available, but don't know where to source it from. I contacted SoftLogik about it but never heard back. Any ideas?

Thanks in advance for any help.

Jerry Martin

PS I would also just like to send my regards to Katherine Ellis - I think it is disgraceful that in our relatively small platform tht someone would deliberately target another Atarian's website.

Hi Kevin,

SICKO's indeed! I wonder if this was done by Mint haters? It hardly
can be. One can dislike a system/OS, but IMO this was done by pure
idiots, "let's hack a site for fun", something like that.
I just wonder what one can do against it. Obviously, either the site
where Kellis has her stuff put away isn't safe or safe is no longer
good enough. Makes one wonder: who'll be the next one?

This isn't just a sad day for the Atari community, it's a sad day for
the whole Internet!

3694. WTB: Atari for MIDI

Newsgroup: comp.sys.atari.st
Date: 2000-03-19 00:00:00 UTC
From: Forrest Egan <fegan@iname.com>
Message-ID: <U_6B4.126$I34.11739@news3.mia>
Source record: 64328

I'm located in the US, Florida to be exact, and I'm looking to get a reasonably priced Atari to use with my MIDI equipment (keyboard, drum machine, etc).

Although I originally set out to find an ST or STfm...from what I've been reading in this newsgroups...it seems that I need a MegaSTe, TT030 or Falcon030 to accomplish my goals.

Does anyone have one for sale at a reasonable cost? I would be hoping to find a complete setup (computer/monitor/software); perhaps some one who's considering upgrading and selling their old (working) system to a starving amateur musician who's just getting started in MIDI and can't afford anything too expensive.

I've found a 520STfm that was reasonably priced (< $100), but from what I'm reading it doesn't sound like it's powerful enough. Opinions?

I can't seem to find the MegaSTe/TT030/Falcon030 models on eBay; any other on-line auctions I could try?

Yes it certainly works, I also have a TT030 64mb of ram plus 2.2gb of
harddrive. Debian GNU/LINUX is the only one available at present, I was
thinking of changing my windows95 to linux with Debian.

To respond to this message, please use the enclosed link rather than your reply button.

Updated as of 03/19/00

I have a limited amount of brand new Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (all contain one controller, RF Box and AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $50
- Atari Jaguar with CyberMorph cartridge $40
- Atari Jaguar (No Cart) $30

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $15
- RF Switch Box $10

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84

- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working SONY SAT-A50 DSS Satellite Receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

Are you sure of this? I hate to argue with an expert such as you (well, I don't really...:-)) but the original argument sounds correct to me!

>The term monochrome is used in the industry to specify the difference
>between black and white and colour systems rather than between greyscale
>and duochrome, and it is not a technical specification..

Then the industry term is simply wrong or unscientific - like so many technical terms in common use. Surely monitors like the SM124 can only have a pixel switched on or off, or have an infinitely high gamma if you like; the only way to get a grey on screen is by dithering black and white pixel groups, just like a printer, or screening in photomechanical reproduction for printed matter (though this can vary the size of the dots as well as their distribution). I suppose the term duochrome is more precisely correct for these, since the phosphor color need not be white. Green is still common, amber less so nowadays.

Greyscale monitors, on the other hand (such as two or tree models sold to replace the Atari 'mono' originals), are just like a b&w TV - they have a normal gamma law and can reproduce pixels of any brightness from full on (normally white, though other colours would be possible) through 'grey' to off (black).

Regards, /Peter/

No - how do I do that? I am using the data that Derryck gave me and which work for him. Yes, it's CIX as my ISP at present; once I've got things working I may try switching to one of the new 'free' ISPs for internetting, keeping CIX for conferencing only.

>the printer to A4 page size before begininning printing! ;-)

Although it's not the full answer, have you tried using CODE.CPX just
before starting to print? You can set up a printer in that to anything
you like, including page sizes.It is fairly easy to modify the
supplied control file. However, this will not work if the Pagestream
driver resets the printer with an Esc E ($1B $45) command before
printing starts or at the start of each page. Perhaps you can hack the
driver and remove the above sequece when you find it. As you may know,
the standard HPGL command for A4, at least for earlier DeskJets like
my 520, is Esc & l 26 A ($1B $26 $6C $32 $36 $41).

Last Updated 03/19/00
- New items added

I have the following Atari ST components, software and manuals/magazines for sale. All the equipment is cleaned and detailed, and in good or better condition, but without boxes unless noted. If you have any questions in regards to unit condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to Jim at jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.ST (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

Hardware Please make an offer
==========
- Atari 520 ST - with mouse but missing power supply (fully functional)
- Atari Mega4 ST - Boxed with keyboards/mouse/power supply
- Atari SC1224 Monitor 13" ST Color Monitor
- Atari PCT1426 Monitor 14" High Resolution TT/PC Color Monitor
- Viking 1280 x 960 20" Monochrome TT Moniter - Boxed
- Atari SF354 3.5" Floppy Drive - with drive cable, no power supply
- Atari SLM804 Laser Printer - boxed with power supply and Laser Printer Controller
- Atari Megafile 44 with built-in Tape Backup - with power supply and cable
- Atari Megafile 60(s) - with power supply (two units left)
- Magic Sac 1 - Macintosh Emulator Cartridge (with manuals, but NO ROMS)
- Magic Sac 1+ - Macintosh Emulator Cartridge (with manuals and ROMS)
- Custom made Atari RGB/Audio cable. Connects an Atari ST to either a SONY XBR or XBR II RGB Monitor
- Best Data Smart One 2400X - 2400 baud modem

Controllers Please make an offer
==========
- Paddles (multiple sets) - for Atari & Commodore units
- 2x Suncom Tac Joysticks - for Atari & Commodore units

- 1x Spectravideo Joystick with suction cup base - for Atari & Commodore units

ST Software Please make an offer
==========
- UltraScript for MEGA ST- by Atari (with manual & software)
- Ultra Script Type Collection - Packages 1-7 (Complete with box, manuals, & software)
- Macro Mouse - The mouse recorder (Complete with packaging, manuals, & software)
- Calamus Desktop Publishing (Complete with box, manuals, & software)
- Spectre GCR Mac Emulator with ver. 3.0 update manual (Box, manuals, software - NO ROMS or cartridge)
- Flash Telecommunications package (Complete with packaging, manuals, & software)
- Flash II Telecommunications package (with manual and software)
- Dungeon Master - by FTL (Complete with box, manuals, & software)

ST Books Please make an offer
==========
- Atari ST Volume One VDI
- Atari ST Volume Two AES
- Atari ST GEM Programmers Reference
- Atari ST Tips & Tricks
- Atari ST Internals
- Programmers Guide to GEM
- MC68040 32-Bit Microprocessor Users Manual - by Motorola
- MC68000 8/16/32-Bit Microprocessor Users Manual (eighth edition) - by Motorola

Manuals & Technical Guides (software status specified) Please make an offer
==========
The majority of the ST/TT manuals are of the binder variety
- Micro C Shell - by Beckemeyer Devlopment Tools (without software)
- LDW Power Spreadsheet - by Logical Design Works (without software)
- Superbase Personal - by Precision Software (without software)
- dBMan - by Atari (without software)
- 1st Word Plus - by Electric Distribution (without software)
- HyperPaint - by Atari (without software)
- Easy Draw - by Migraph (without software)
- Regent Base/ Regent Base 2 - by Regent (without software)
- Publishing Partner Professional / PageStream -by Soft Logic (without software)
- Publishing Partner - by Soft Logic (without software)
- Touch-Up - by Migraph (without software)
- Microsoft Write - by Atari (without software)
- Codekeys The Macro Tool - by CodeHead Software (without software)
- Degas Elite - by Intregal Sollutions (without software)
- Brataccas - by Psygnosis (without software)

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision

Considering she has been absent from this NG and doing her own thing, not offending anyone, or being offended, I find that I am ready to shove my MAGIC SOFTWARE right in the TRASH!!! Heres PRO MagiC* for you. I wouldn't be surprised if she just left Atari Totally. All that work lost. All the effort wasted. And I don't even use MINT, but I feel the loss.

Amazing when COMMERCIAL software lovers attack/HACK a PUBLIC DOMAIN OS.

Kinda a REVERSE MS vs Linux Battle wouldn't you think???

Its obvious that the losers don't read this NG, and Regardless of what BENGY may say, I would certainly think that they do read his WebPage.

I have not heard of a bigger act of Cowardice in my time here on comp.sys.atari.st

I almost feel like selling off my Entire Atari Collection. This is not the stuff I wish to be associated with. I liked the Atari Community, and these losers are part of it, and I no longer wish to participate.

Be Prepared for an Itemised List in the next few weeks of ALL my Ataris and HUNDREDS UPON HUNDREDS OF BOXED COMMERCIAL SOFTWARE to be distributed in one shot. Falcon, TT, MEGASTe X2, MegaST2 X2 and alot of STes, STs, are all going.

I don't want to participate in this NG if this is the type of crap I am going to have to read.

Good Work ASSHOLES.

I am really pissed.

Brian.

Howdy Brian,

please, don't take it that far... perhaps that's what they're waiting
for.
My idea is those suckers tried to hide behind a "pro-MagiC phrase",
just to get fingers pointing. They maybe not even reading this NG,
OTOH they probably did know a bit. Kath' never liked MagiC, so she
told us/wrote us and perhaps these morons didn't like Kellis and next
found "a reason" for their actions. IMO the whole idea behind it was
"let's try it and C what happens", simply for the pleasure of screwing
a site. Anyone elses could have been the target.
The Atari scene still sticks together firmly, there is no reason for

you to quit. Not these reasons. Cool off for a day or 2 and reconsider.

It's about time to reconsider on Internet's safety. If morons can crack Fort Knox, they can crack anything. The example shows us that also www-sites are no longer safe.

Hello, I received a lot of email telling me there was some motion going on about me and I decided to write a message here eventhough I don't read this newsgroup for many obvious reasons. So any answer should be sent to my personal email address.

I just do not understand (and probably will never) magic user people. They are getting "ripped off" by a commercial company, yet they give everything they have back to this company. All that for the sake of "preserving the commercial side of it". I am down for commercial stuff (bought myself several piece and will continue for atari). But When a product is not satisfactory to my needs, and this very same company bashes on some alternative just to promote their own. This is not fair at all.

No exports and little support for NON DE people. Fine, but then how can you complain about a non existant or too little market outside DE if you don't make the effort to export appropriately?

If you are to bash an existing market, do it correctly and propose a "killer" (no pun intended) application/environment. (The answer is not magic i am sorry).

Proposing the magic emulation is a good idea if you see the atari market as being dead. I don't see it as dead myself. (call me crazy).

End users needs programs, programs needs programers, programers at least need 2 things; fun hardware and documentations. This cycle has somewhat been broken.

Magic people (not all of course, but a good number) show no respect for MiNT development which I am sorry to announce is as big (as far as number of users) if not bigger than magic user base. (but of course no one would admit such thing).

What is the lesson to take out of all this mess?
kellis will continue to support atari, no doubt about that.
kellis will support MiNT tools and applications.
kellis will port tools from gnu/gpl/unix world to MiNT.

None of the above will be magic compatible. This is a serious warning if you want to preserve your data, just don't use my software/ports at all.

Hope this cleared a few points.

Happy Magic'ing, happy singletos'ing and happy MiNT'ing all.

The perfect OS/Hardware is not out yet. so we are not in bad shape on our atari.

kellis

You must tell pppd which account to use, add "user byttebi" (or was it
"account..."? Can't remember right now, try both) to .ppprc.

> games inferior to the Amiga versions! Even the audio performance, of
> which I had heard so much about, was slightly better than the one of a
> Commodore 64!

The Amiga had a slightly better graphics chip than the Atari, and the
Atari's sound chip was CRAP from the start. It was the same Yamaha chip as
the Amstrad CPC or ZX Spectrum, and yes, no better than the SID chip in the
C64.

This was improved with the STE a couple of years later, which had stereo DMA
sound and a slightly improved graphics chip. Nevertheless, this was too
little too late, and the majority of developers kept on writing games for
the 520STF because of the larger market.

So, in a sense, I beleive the Amiga was a slightly better machine for games,
but the Atari had a better offering of serious software, especially in DTP
and MIDI, mainly because of the fantastic monochrome display (no Amiga could
ever get close to the comfort of that screen) and the famous MIDI ports.

> So am I missing something here? Which games were the best of the Atari
> ST?

You've obviously never played Dungeon Master :-)

Seriously, speaking for myself, the Atari was 1000F (100UKP) cheaper than
the Amiga, which meant that it sold better and most games were pretty much
the same.

> Ok, let's start talking about the old argument again.. :) I'm not trying
> to start a flame war, just a polite conversation.

Nevermind, it'll end up as a flame war in a couple of seconds! ;-)

I recently purchased a Yamaha PSR-83 keyboard, and am wanting to get
into Midi sequencing.

What I've got:

1. 1040ST with mono and color
2. 20MB Hard drive
3. MIDI cables

What I don't have:

Some MIDI software. Does anyone have a suggestion of what software to
start out with, and maybe some tutorials on sequencing?

Thanks!

Grateful for the corrections, refinements and further info, to my tentative remarks on this, by respected contributors, I still think the consistent use of upper case C for the usual C partition is useful, because I vaguely remember being totally flummoxed by some program intructions in my early days getting to grips with an Atari, which kept referring to lower case c:\ as the hard disk, while the manual was insistent it referred to a cartridge. See what I mean? Thanks particularly to Thomas Binder and Derryck Croker.

>one last year, a Deskjet 500 for $10, but I passed it up
>because it looked like it had been used very heavily. Might it
>have been all right?
Some of the old Deskjets are great. I printed several pages off
of my 500 (circa 1992) last night. However, I have some real
problems with missed lines now that cleaning doesn't seem to
help. Nothing lasts forever, but at $10 I'd have taken a chance.
New Deskjets are questionable. I just bought a 610CL (as near
as I can tell, it's identical to a 612C) for $90. Good B&W,
decent color, but much lighter plastic. Who knows how long
it'll last?

>Do inkjet carts go bad if they sit around for a month or so
>between uses?
Inkjets DO dry out, but as it's water soluable ink, I think
you'd be O.K. I've never gone more than a week between
printings, myself.

>
>Some of the new Deskjets and Laserjets are quite attractive,
>and so are some of the prices. I saw a Deskjet 612c listed at
>$89, with a $30 rebate offered from HP. What about one of
>them? Can a newer Deskjet or Laserjet be configured to emulate
>an older model if an older driver is used?
Usually. My 610CL uses the 600 and 500 drivers without trouble

with NVDI set to B&W. So far, only Imagecopy and Pagestream have been able to make it print in color, and Pagestream does a poor job. Fortunately, Imagecopy is all I need right now colorwise. Actually, if you are only sending ASCII, the 610CL doesn't even need a driver. On the other hand, the 610CL has no Epson emulation like my 500 has.

>hard drive I should be able to rearrange the order of the auto folder and

There's often a key combination which will prevent the loading of the AUTO folder, but if you can't find it try these steps:

Switch your computer on and wait until you get to the desktop (a blank formatted disk in A: will speed that stage up).

Switch on your hard drive

Insert the disk that has the driver software for your drive, and run the driver program (might be in an AUTO folder)

One that's finished, install an icon for the C: drive on your desktop and open the AUTO folder. I'd suggest disabling all of the progs inside aside for the HSModem stuff, and add them back one by one until you find which one causes the problem. From the ones you list I'd suggest keeping the TOS fix, the folder100 fix and HSModem (the latter should be the last ones to run in the auto folder, unless you have internet stack software).

If you don't have the driver software for your drive then you can download AHDI from many ftp sites, or Uwe Seimet's HDDriver demo from his web site.

HTH.

>
>No - how do I do that? I am using the data that Derryck gave me and

There's a terminal built in to IConnect, you just pick it from the script entry popup in IConf. However, CiX like many other ISPs doesn't need a script. Just the phone number, any modem init strings and a simple "Done" with the PPP box ticked. Proxy servers are optional, unless you're using ASH's Emailer - that picks up stuff like your mail server from IConnect.

>things working I may try switching to one of the new 'free' ISPs for

It's much easier to set up, but for your purpose you're possibly better sticking (cough) with STinG :-)

Actually, the Atari's audio is vastly inferior to that of the C64. Its
waveform variation is nonexistent, whereas there are four types in the SID
chip.
What ade the Atari renowned for audio uses was its MIDI hard and software,
not the poor Yamaha chip.

Nope, it needs to run last unless you are running STinG, in which case
that goes after HSMODEM.

Possibly, but nobody with a web page can dictate who reads it (unless
it's password protected). I can't see Bengy having anything to do with
these idiots.

> I almost feel like selling off my Entire Atari Collection. This is not

Don't give in to the impulse.

I must confess I had similar thoughts about just walking away if we're
down to this kind of mindless vandalism. However, there are too many
good people here for me to do that. And I for one am not about to let
some peabrained moron mess up one of my favourite places on the net.

Chill a little and stick around.

John

3732. Interview with ASH

Newsgroup: comp.sys.atari.st
Date: 2000-03-20 00:00:00 UTC
From: bengy@home.com
Message-ID: <8b46mj$id0$1@nnrp1.deja.com>
Source record: 64212

I just uploaded a brief interview with Oliver B of ASH onto MagiC Online.
The following questions are answered in the interview: (English and German)

Do you still or ever have actively used an Atari-compatible setup? If so, please describe it. (i.e. MagiCMac on G3)

How did you first get involved in Atari computers?

Your name is well known in relation to Atari and ASH. When did you start at ASH, and has your job changed much since you did? What is your favorite part of your job, and your least favorite?

Is ASH stock publicly traded?

When was ASH founded? Has it ever be an Atari-Only software company?

Why does ASH still sell Atari-products? What is the motivation behind this, as it surely can not be purely for financial gain.

What does the upcoming Milan 060 (a.k.a. Milan II) mean for the Atari market? Does ASH plan on supporting it 100%?

What is ASH's opinion regarding N.AES? Do you feel that it is superior to MagiC?

Regarding CAB, are there any plans to continue the development seriously? If not, then will the ASH-Webbrowser slot be left occupied by an outdated browser, or will we see a new one soon?

How do you react to statement's such as "ASH is the Microsoft of the Atari world.." Do you think these comments are justified?

Everyone was surprised when ASH released Emailer, RSM etc out of no where. How does ASH find and decide which programs they are going to distribute?

What do you feel was the biggest mistake made by the Atari Corp.? Could they have did anything different to still be around today?

Which version of MagiC is selling the best? And the least amount? (PC, Mac, Atari, Milan)

Which is your best selling Atari program?

Has ASH ever had "in house" Atari programmers?

Is there currently a large problem with Software piracy on the Atari Platform as there is with the mainstream platforms? Has ASH taken any steps to help prevent piracy?

Are there any plans to open an Application Systems America?

What role did ASH play in the recent decision to have MagiCMilan the default OS of the Milan II? Rumors suggest that it was AXRO's decision based solely on the look of MagiC. Is there anything you can add to this?

No computer shop can live solely off sales of Atari computers and software in it's current situation. How come there is no possibility to order/pay through Secure Connection on your site? Would this not encourage more sales, including from over seas?

In a recent interview with Volker Ritzhaupt of ASH conducted by MacGadget, Volker suggested that ASH still had some surprises left for the Atari market. Can you give us some hints?

The future of Atari: Is there one? Do you think the MilanII stands a chance of becoming a household name, or is it too little too late?

Any other comments?

Hi Brian,
Hmm, I never said that I thought they don't read my site. I said that I had nothing to do with it and I am very ashamed at the way these people acted. Although, I agree with the idea that these people just used the MagiC/MiNT war(s) as an excuse/overlay.
I was On #atariscne and kellis told me about it, I was just as shocked as everyone else Im sure.

Anyway,

On the other hand Brian, I check out his site everyday and I would
never even think to do this sort of mindless action. As Louis said
these people (using the term losely!) maybe just using the MiNT v
MagiC as an excuse or just wanted to do this anyway. I personally
use MagiC because - and after a very helpfull chat with Kellis incidently
- it doesn't require the memory of a full MiNT setup which my system isn't
capable of. Surely it's not the authors of MagiC or other 'normal'
users who are to blame for the vandalism of her site just because these
nutters leave a message mentioning Bengy's site?

>I almost feel like selling off my Entire Atari Collection. This is not
>the stuff I wish to be associated with. I liked the Atari Community, and
>these losers are part of it, and I no longer wish to participate.
>
Again, think of how many Atari users you have conversed with in emails
and newsgroup postings and surely you know that these idiots are not
representative of the majority of users. I'm sure you may stumble
across the odd lunatic in virtually any large group of people so I
would hope you will still contribute your input into the group.

>Be Prepared for an Itemised List in the next few weeks of ALL my Ataris
>and HUNDREDS UPON HUNDREDS OF BOXED COMMERCIAL SOFTWARE to be distributed
>in one shot. Falcon, TT, MEGASTe X2, MegaST2 X2 and alot of STes, STs,
>are all going.
>
I would hope after you've reflected a little on this that we won't be
receiving *any* of the above for sale.

Best Wishes
Sean

> Strange, I always thought that you could only play games on Amiga, but of course
> I have never seen a Amiga in my life.
And it shows! Ever realised that the Amiga was multitasking whilst the
(spit) PC was still a glorified typing machine? (And still is)
> Please get youself a PC, they're uncomparable.
Oh perlease you think anyone in their right mind would buy a platform
that is fundamentally flawed and filled with the over-priced and
poorly written dross thrown out by those crooks at Microsoft.
I'd even rather have a Mac than buy a PC knowing that Bill Gates and
Intel are laughing at me knowing that what Ive just bought is ALREADY
out of date and will crash on me every time you try to do anything.
>>
Anyway, back to the topic in hand, the whole Amiga/Atari thing
fascinated me at the time and in some ways still does. In fact Im
trying to buy an ST despite the fact Im an Amiga user but I did borrow
one once and Ive played on them extensively at friend's houses whereas
I always ran on Amigas in my house.
The point being is that both machines have their virtues. The ST in
its favour was smaller than the Amiga (all comparisons are made with
the A500 naturally although I welcome a Falcon/A1200 debate but I know
nothing about the Falcon about from its hardware configuration) it had
a attractive layout, it didn't have an exterior power pack-just a
normal kettle plug, it also didn't need an add-on to plug into a TV
unlike the 500. And of course it also had a built in GUI whereas for
the Amiga you have to insert Workbench.
However, the ST had its mouse/joysticks port in a ridiculous place
down below - meaning you had to lift up the thing each time you wanted
to play two player and the plugs were upside down! That and every game
took AGES to load in comparison to the Amiga. Plus the ST wouldn't
always read double density disks I think the STE did or something.
Yes in some respects the ST was closer to a C64 than the Amiga in
terms of performance. The Amiga was definitely the more
technologicaly advanced machine. As far as games are concerned though
it seems that the older the games the better as they are less
different. Most early nineties games are clearly better on the Amiga
than the ST whereas late eighties stuff is about the same. Games that
I know are better on the ST though are few, but R-Type for one was a
way better arcade conversion but that was down to Factor 5 being a bit
lame. (Although they got better later with Turrican)
By the way Alkis your ST emulator, I take its a ST emulator for the
(spit) PC if its for the Amiga any chance I could have a copy for
obvious reasons?

> other on-line auctions I could try?

Hi Forrest,

From your original post I believe you were under the impression that Atari ST's and STE's are inferior for midi.

THIS IS DEFINATELY NOT THE CASE!

Even the oldest ST will run a midi sequencer with superior timing to ANY other computer as long as you have... at least 1mb of memory (you could probably get by with 520k, but it doesn't leave much headroom) and a high res/autoscan monitor (to give you a comfortable display to work with... although there are some sequencers that will work ok in medium resolution)

Don't pay much attention to the number on the case (ie 520ST, 520STE etc.) as the memory will most likely have been upgraded anyway, and an STE is very easy to upgrade . Check the memory with a system checking program to be sure.

However, if you want to have an audio output (as well as midi) from your atari, it will have to be a Falcon. But midi-only sequencers will be fine on any old ST.

Cheers, Simon.

3746. Atari-Midi Mail list Created

Newsgroup: comp.sys.atari.st
Date: 2000-03-20 00:00:00 UTC
From: Tim Conrardy <tconrardy@hotmail.com>
Message-ID: <8b5ghs$f8c$1@nnrp1.deja.com>
Source record: 64226

HELLO ALL:

I would like to invite any of you
to join the list I have just created which deals with Atari-Midi
specific stuff. This came as a result of discussions on this newsgrp to
meet the need of an Atari musicians wanting to discuss only Midi
things.It is hosted by ONE-LIST.Here is the info.
PS..You can subcribe by using the address provided, or you can go to
the URL and subcribe from there.It might be slow for a while untill we
can get more members. Should be GREAT FUN.See you there!!

Thanks

Tim Conrardy

Atari and Midi. Discuss Atari specific midi applications. Share
information
regarding your favorite Atari Midi programs including some of the more
exotic applications such as Tunesmith, ludwig, and other algo-comp
Programs
along with favorites such as Atari Cubase, Notator, Master Tracks Pro
and
more. Help and sopporting others with their Atari Midi setups.

3747. Scart cable for an Atari ST-E

Newsgroup: comp.sys.atari.st
Date: 2000-03-20 00:00:00 UTC
From: NetWorld Research <jmarin@jet.es>
Message-ID: <8b547mjjd1@talia.mad.ttd.net>
Source record: 64227

Anybody knows where I can buy a ready-made Scart cable to connect my ST-E to
a Sony TV?
I tried to made it but it's impossible to find in Spain the video-plug of
the Atari ST-E-
Better in Spain or Europe, but if not, in the U.S..

Thank you !

3748. Re: WTB: Atari for MIDI

>
>

I would agree with Simon here. All you need is a 1 meg machine for most
midi stuff. I run Notator on a 1 meg 520St!!!
True...more memory would be better, BUT it works!!!
Most other midi stuff works as well...Master tracks pro, Tunesmith,
editrack, ect. Just the early 520's with less then 1 meg will not work
well.

Tim

As far as developing computer technology is concerned , it's obsolete.
Sorry...I like it, but
to disagree is to have fundamental misunderstanding of computer software
development. Use
does NOT mean that it has been superceded. However, the fact that you use it
means that it
is still worthwhile ;-p

>
> The owners, and ultimatley the future owners/users. Its only a viable
> product if the owners can make money on it and it pirate users like
> yourself just go out and steal it to order then it does not give them the
> confidence to develop it any further, isnt that why there is no further
> development of Atari software. Ultimately you yourslef are responsible for
> it being 'obsolete', you are removing the profit from the owner

How can the owner profit from a product that he no longer sells?
Copyright money is payable on sales; this DOESN'T include old ROMs from system
solutions or wherever;
it's already paid.

> who in the
> end are doing this /only/ to make money. In short youve created its
> obsolecence youself by advovating its theft.
>

BUT if the product is no longer being developed and clearly will not ever be
again,
then you are fighting your own atari advocacy principles by excluding use of
the rproduct due to
it's lack of widespread availability. Don't get me wrong....I don't advocate
cracked software as a rule
e.g. the games that are always being sold on cd in this group.

>
>
> They are not interested coz they are a massive corporation who dont
> interface with consumers, relying on authourised service personel to do
> things for them. You wouldnt go to Shell head office for oil would you!!

Wrong they are not interested because the numbers of users is still too small to
make it financially viable for them to rerelease the product. In fact, the current owners
of the copyright probabaly are barely aware of their possesion at all....there is no longer any
commercial point in exploiting it.

Sorry if this comes on a bit strong, but I think Pera is RIGHT; ultimately, he is advocating the platform and
in real world law there are billions more lost on music piracy or even windows piracy than copying atari roms.
The people who copy these roms/images either already use the computer (and therefore own a license for the
copyright for a version of TOS anyway) or might be drawn to the platform through emulators....they certainly won't
come otherwise.

C-ya,
paul ;-p

>

>
Fortunately, a friend has heard of my plight and has offered to send me the SLM804 that's currently taking up space on his porch. He says it works ok, as far as he knows, but needs a drum and some toner. The drum and toner from my present printer should take care of that. However, there is, of course, no guarrantee just how long this 804 will last, either. So, I'd like to continue this discussion for future reference.

I appreciate all your comments and suggestions, but they bring up several more questions. The consensus seems to be against inkjets, mostly because of the cost of ink carts. The President of my old user group used to create newsletter pages on his Deskjet 500 with an STe, and they compared favorably with those created by the former owner of my SLM804. He used to claim he refilled his ink carts and the refills cost him just pennies each. Doesn't that work any more? I see ads for refill kits in the back of Computer Shopper, so you'd think it was at least possible.

I had thought to keep my eyes open at garage sales this spring for old printers that have been retired in favor of the newer ones that have been offered with so many great rebates. I expect to find many more inkjets than lasers, with Deskjets being the most common. Do Deskjets hold up well? I saw just one last year, a Deskjet 500 for $10, but I passed it up because it looked like it had been used very heavily. Might it have been all right? Do inkjet carts go bad if they sit around for a month or so between uses?

I stopped in at Ebay last night, and a search on "laser printer" yielded 314 hits. I looked at the first 150, and saw several HP Laserjet IIs, a few IIIs, quite a few 4s, some 5s, several I can only assume are bigger or newer, not suitable for home use. The IIs were mostly reasonably priced. Assuming the sellers description says the printer is working, how likely is a II to last a while? And what kind of footprint does it have?

Some of the new Deskjets and Laserjets are quite attractive, and so are some of the prices. I saw a Deskjet 612c listed at $89, with a $30 rebate offered from HP. What about one of them? Can a newer Deskjet or Laserjet be configured to emulate an older model if an older driver is used?

Alas, it's more fun to chat with narrow-minded
people who think "PC" means "clones of the IBM
personal computer", because when they ask if
our machine is "compatible" we can say "Oh no,
ours is a REAL computer."

These are the same people who think "Megahertz"
means "power", ignoring the concepts of "hardware
efficiency" and "software efficiency".

Besides ... the Amiga was originally developed
for Atari as the ultimate game system and only
wound up at Commodore during some last-minute
shenanigans. Honestly, you should put an Atari
logo on your Amiga.

Jay Miner designed some 8 Bit computers at Atari and that's the only
thing Amiga and Atari have in common. Amiga Inc. was an independent
company. When they got into financial trouble Commodore bought them
for $4.25 a share while Atari's Tramiel offered them 98 cents....

If Atari, aka Tramiel hadn't been so arrogant Atari would have owned
Amiga. Basically Atari loaned Amiga some money at some point, when
the loan was nearly due Amiga talked to Atari about just buying them
out, but instead of trying to compromise and negotiate in good faith
on the price Tramiel offered a ridiculously low price. So Amiga wound
up talking to Commodore and the rest is history.

Yeah, I agree. From what I read somewhere, Atari only wanted the
Amiga for the chipset.

... lucky for us democoders they didn't get it :) The most fun I had on the atari was to get around the limitations in the hardware. Many of my Amiga friends turned to me when they needed weird 68k optimizations, and they were stunned when they learned about how we removed the borders and did syncscrolling (aka hardware scrolling) on a machine that wasn't supposed to be able to do it.

Eventually two members of Sync became Amiga owners, and one even joined an Amiga demo group. Two different machines for different tastes, I would gladly have owned an Amiga myself too.

Red Fox / Sync

Hi Pete

>>Have you tried running a terminal to see what questions and responces are
>>required. What is your ISP?, CIX i presume.

>No - how do I do that?

Using something like connect, type atdt <ISP phone-no>, and then watch the
screen, the ISP will ask certain questions, you can follow with an
appropriate responce, have connect buffer the screen, you can then graft
this question / responce sequence as appropriate in iCon

Although if CIX is a PPP setup then you shouldnt need any of this
scripting, just the details plumbed into iConf.

>I am using the data that Derryck gave me and which work for him.

If it worked for Dezza it should be a 'drop in and use' for you!.

Wayy back when I had my Falcon I used MultiTOS which came with the Falcon,
For some stupid reason I can't get it to load anymore, would not load off HD
for a start I had to boot it off floppy which was stupid. Is it on the net
somewhere to download ?

Thanks

Chris

```
Are you sure they are 720K disks? Early 520s had a single sided floppy with
the 360K capacity.

If you are in doubt, use the sysinfo utility from:
http://bales.online.fr/atari/files

Agreed as to the case of 'c:' but are you sure that it is DMA? I thought it used a different set of address registers. Anyway, I have two cartridges; one is very common: a clock cartridge (of which there are several variants), the other is a VT100 terminal that I picked up cheaply. I know that there was also a cartridge version of Fast Basic. And of course there are protective dongles for Cubase and some other programs. Anyone have a more complete listing of Atari cartridges?

And what might that be/do? Actualy there seem to be two separate
mini-icons to the left of the text line. I don't know what either does.
Does anyone have any instructions about the new hotlist in CAB 2.7 -
English or German? If so, any chance of a copy, please?

>It's bad enough when even a minority steal.

Yes, but the essence of theft is that you deprive the owner of the use
of the item - as in the Aston Martin analogy posted here earlier. Who
are you depriving of anything when you copy something that is no longer
available in the market? It has been said that some dealers still supply
some TOS versions and they would lose out. I accept that - if there are
such dealers. It's up to them to make themselves known and tell people
that they can supply, and in which territory. Many people would be happy
to pay for no longer available items - if they knew where!

Regards, /Peter/

Hi Trevor!

I don't know if you realise this, but there is no such thing as a
generic printer driver for most Atari programs - most have their own,
though those that print via GDOS can use common drivers supplied with
NVDI.

As regards First Word Plus - you can adapt any existing *.HEX file and
compile it to *.CFG with the INSTALL.PRG supplied in the distribution,
provided that you have the correct control codes for your printer. One
thing to watch is that though the data has to be all in hex, numerical
data (say for characters per inch) needs to be in hex-coded decimal for
each digit. As an example, the code for many HP printers (like my
DeskJet 520) for character spacing is 1B,28,73,n,48 in hex, where n is
the cpi. If this is, say, 20 for condensed elite, you have to input
32,30 here (= 2,0 in decimal) and *not* 14, which is the hex equivalent
of decimal 20. Condensed pica is normally 16.67 cpi but can be rounded
to 17 cpi, so use 31,37 for that; elite is 12 cpi so use 31,32 and pica
is 10 cpi so use 31,30. Note that you can't get fully justified print
with proportional fonts, as 1WP only counts the number of characters per
line without taking character widths into account.

I believe Timeworks uses GDOS for printing, so NVDI drives should do.
Don't know if there is one for the 710, but you coud always try the
Behne Brothers if it is not provided.

Regards, /Peter/

Hi all!

I've tonight visited the new Dead Hackers Society website at
http://www.dhs.nu (or you can get to it from dhs.atari.org).

However before all the files have loaded, Cab crashes with a Bus Error. :(

I've spoken to Anders Eriksson (aka Evil) of DHS on IRC, but he couldn't
explain it.

I'm using Cab v2.7c, under MagiC v6.01, StiNG v1.22, and Dan Ackerman's
latest Cab OVL, v1.4002 (I also tried an earlier OVL, but with the same
results).

Can people please test it with their system and let us know here?

Cheers!

James

I can't tell you the version, but I can tell you a bit about the
Barefoot above.

If I remember correctly (back in the dim recesses of my mind that
remembers the early 90's), Hybrid Arts was either a) going out of business
or b) going out of the atari business. When this happened several of the
programmers got the rights and started barefoot software. So don't worry
about it being barefoot as opposed to hybrid arts. All that changed was
the company and not the programmers.
